## Web Appendix:

## The American High School Graduation Rate: Trends and Levels

This appendix provides supplementary tables and figures as well as a detailed description of the data and methods used in "American High School Graduation Rates: Levels and Trends" by Heckman and LaFontaine.

## Part A. Data and Methodology

This section describes the data sources and methodology used to compute the graduation rate by race and sex in each year.

## HOUSEHOLD SURVEY DATA

Our analysis includes two major sources of household survey data to analyze high school graduation levels and time-series trends. We now provide further details of sample construction and the methodology employed to compute graduation rates in each source.

## 1. CENSUS INTEGRATED PUBLIC USE MICRODATA SERIES (IPUMS)

Data Source: http://usa.ipums.org/usa/
Description: The Integrated Public Use Microdata Series (IPUMS) is based on thirty nine high precision samples of the U.S. population and is administered by the Census Bureau. The IPUMS is a sub-sample of the decennial Census that is based on a longer questionnaire and contains more detailed information about individuals and households than can be found in the complete enumeration of the U.S. population using the Census short-form questionnaire. In general, the IPUMS data are available each year in a $1 \%$ sample of the total U.S. population or a $5 \%$ sample. ${ }^{1}$

The Census IPUMS data is used for the baseline estimates for the high school graduation rate and is important because it covers the entire U.S. population. Unlike the CPS household survey, Census sample coverage is high and the sample includes both the institutional and armed forces populations.

The major drawback of Census data is that it does not allow us to distinguish between those who graduate high school and those who dropped out and later obtained a GED certificate. Therefore, we need to estimate the total number of reported high school completers in the Census (HS Graduates+GED) who are actually GED recipients in order to obtain true high school graduation rates. Furthermore, we need to estimate the fraction of GED recipients in the civilian, incarcerated, armed forces and recent immigrant populations in order to assess the bias that results from excluding these populations in CPS data. These detailed breakdowns of GED sources are only performed in the 2000 Census since the data that make these calculations possible is not available for earlier years. For earlier years we only need to estimate the number of recent immigrant GED recipients and the race/sex distribution of GED recipients to estimate the final graduation rates reported in the paper. Table A. 1 provides the initial totals by education for 20-24 year olds in the 2000 Census. Tables A.8(a) and A.8(b) show the final totals we obtain after disaggregating GED recipients from high school graduates in order to estimate the bias on graduation rates due to each source. The details of these GED calculations are provided below.

Sample: The Census samples used in this paper are taken from the 1970, 1980, 1990 and 2000 IPUMS data. The details of the sample construction in each year are as follows.

## 2000 Census:

Our 2000 IPUMS data are drawn from the $5 \%$ population sample. The sample is restricted to those between the ages of 20 and 29 . Those who are still enrolled in high school or below for the $20-24$ year old sample are also excluded. No other cases are deleted and there are no missing values in the variables used in our analysis. ${ }^{2}$ The total sample size of individual's ages 20-24 is 863,229 unweighted and $18,642,465$ weighted. The total
sample size of individual's ages $25-29$ is 909,096 unweighted and $19,178,062$ weighted. The population totals by race, sex, education and immigrant status are given in tables A. 1 and A.2, respectively.

## 1990 Census:

Our 1990 IPUMS data are drawn from the $5 \%$ population sample. The sample is restricted to those between the ages of 20 and 29. Those still enrolled in high school are not excluded in the 1990 Census because the enrollment variable does not provide grade level of enrollment. No other cases are deleted and there are no missing values in the variables used in our analysis. The total sample size of individual's ages $20-24$ is 876,723 unweighted and $18,588,832$ weighted. The total sample size of individual's ages 25-29 is 1,009,673 unweighted and 21,245,319 weighted. The population totals by race, sex, immigrant status and education status are given in tables A. 3 and A.4, respectively.

## 1980 Census:

Our 1980 IPUMS data are drawn from the $5 \%$ population sample. The sample is restricted to those between the ages of 20 and 29. Those who are still enrolled in high school or below for the 20-24 year old sample are also excluded. No other cases are deleted and there are no missing values in the variables used in our analysis. The total sample size of individual's ages $20-24$ is $1,045,819$ unweighted and $20,916,380$ weighted. The total sample size of individual's ages $25-29$ is 971,903 unweighted and $19,438,060$ weighted. The population totals by race, sex, immigrant status and education status are given in tables A. 5 and A.6, respectively.

## 1970 Census:

Our 1970 IPUMS data are drawn from the 1\% Form 1 State sample. This sample is used because it includes immigrant status and year of entry into the U.S. The sample is restricted to those between the ages of 20 and 23. We restrict the sample to age 23 instead of 24 in this sample because there is a major trend break in graduation for those born before 1946 and those born in the baby boom following World War II. Those who are still enrolled in high school or below for the 20-23 year old sample are also excluded. No other cases are deleted and there are no missing values in the variables used in our analysis. Unlike previous Census data, GED recipients are included in the dropout category in the 1970 Census and do not need to be estimated
from independent data. In 1980 the Census Bureau explicitly told GED recipients to report completing high school according to IPUMS documentation while in 1970 they were to report the highest grade completed. The total sample size of individual's ages 20-23 is 132,300 unweighted and $13,230,000$ weighted. The population totals by race, sex, education status and immigrant status are given in tables A.7.

## Variables used in the Analysis:

Age: The Census provides a variable (AGE) giving the age of each respondent in the household. We restrict our graduation rate calculations to two cohorts in each Census, those between the ages of 20-24 and 25-29. The two cohorts provide a summary measure of the national graduation rate between Censes since they cover a ten year span and the Census is administered on a decennial basis.

Sex: Sex is determined in each survey using the Census provided variable (SEX).
Race: The Census provided single race variable (RACESING) and Hispanic ethnicity variable (HISPANG) are used to code the following race/ethnicity categories: white non-Hispanic, black non-Hispanic, Hispanic and other non-Hispanic (all other races).

Group Quarters Status: Those living in group quarters (including the institutional and armed forces populations) are identified using the variables (GQ) and (GQTYPED).

Age of Immigration: Age of immigration to the U.S. is constructed using (YRIMMIG). Recent immigrants are those who entered the country in the past ten years for 20-24 year olds and the past fifteen years for 25-29 year olds.

HS Enrollment Status: We restrict those 20-24 year olds still enrolled in high school using the (HIGRADED) variable for the 1970-1980 Census and (GRADEATT) in the 2000 Census. It is not possible to exclude those still enrolled in high school in the 1990 Census.

HS Completion Status: For the 1970-1980 Censes, years of education are reported as the highest grade completed. For the 1990 and 2000 Censes, years of education are reported differently: by categories for first
through fourth grade and for fifth through eighth grade, by year for ninth through 12th grade, and then by degree attained. We use the variable HIGRADED for the 1970 and 1980 Census. The variable EDUC99 is used to code education for the 1990 and 2000 Census. Dropouts are those who report less than twelve years of education (including those who report 12 years of schooling and no HS diploma). High school completers are those who report twelve years of schooling (and received a diploma) or higher. Those who have completed some college are assumed to be high school completers (GED recipients or HS graduates) in all years. For recent years there is evidence that larger fractions of uncertified dropouts are attending college. This will serve to add a small upward bias to the rates reported in recent years.

## CALCULATION OF GED RECIPIENTS FROM TESTING SERVICE DATA

In order to calculate the number of reported high school completers who are GED recipients in each Census year we make use of national data provided by the GED testing service (GEDTS) on the number of credentials issued and the age distribution of those who obtained the GED in a given year. These are contained in the annual publication "Who took the GED". We use this information to construct cohort total for those ages 20-24 and 25-29 in each Census.

In order to determine the total number of GEDs attained by each cohort up to that year, we calculate the number of GEDs attained every year before the most recent census year for 10-13 years. So in order to capture all GEDs attained by a particular cohort, we calculate the number of GEDs attained each previous year by the same cohort. To do this we sum the GEDs attained by the $25-29$ cohort in 2000 with the GEDs attained by the same cohort but now 24-28 years old in 1999, the GEDs attained by the 23-27 year olds in 1998, until we reach 16 year olds in 1987 (those who are 29 in 2000).

If the age ranges given by GEDTS are given in a range (e.g. 20-24) then we assume that the probability of GED certifying is uniform across the given age range. Table A. 9 shows these calculations in detail for the 20-

24 and 25-29 Census 2000 cohorts using 1999 and 2000 GEDTS data. This method is used to calculate the total number of GED recipients in each Census and comes very close to estimates obtained from independent data sources (See Table S.1). We now have the total number of GEDs in the 2000 Census by age range but we still need to disaggregate this total further to assess the impact of excluding certain populations while still excluding GED recipients.

## 2. SURVEY OF INMATES IN STATE AND FEDERAL CORRECTIONAL FACILITIES (SISFCF)

Source: http://www.icpsr.umich.edu/NACJD/sisfcf/
Description: The Survey of Inmates in State and Federal Correctional Facilities is a nationally representative sample of inmates in state and federal correctional facilities conducted by the Bureau of Justice Statistics. Inmate information such as criminal records, demographics, prison activities, and previous military service are included. The survey has been conducted in 1974, 1979, 1986, 1991 and 1997.

SISFCF is a large scale nationally representative sample of all jail inmates in the United States with detailed educational breakdowns of those currently being held. Most importantly for the purposes of this paper, it is possible to identify those prisoners who graduated high school versus those who dropped out and later obtained the GED credential. We use this information to estimate the number of prison GED recipients in the 2000 Census. The distinction between GED recipients and high school graduates is not available before 1991.

Sample: Inmates of 1409 state and 127 federal prisons were surveyed on basic demographic information, educational attainment, criminal history, sentencing and family background among other categories. This paper uses the 1997 wave of SISFCF to estimate the number of inmates by education level currently
incarcerated in state and federal prison system in the 2000 Census. We use the 1997 SISFCF data for this purpose since it is the closest available data in time to the 2000 Census. The total number of observations in the original sample is 18,326 . We exclude 140 observations for which educational status cannot be determined resulting in our final sample of 18,186 observations.

## Variables:

Facility Type: State or Federal prison status is coded using the original variable V1959.
Age: Age is coded using the original variable V2054.
Sex: Sex is coded using the original variable V2053.
Race: Race is coded using the BJS categorical race variable R233.
Education: Education and GED attainment status is coded using the following variables: highest grade of schooling attended and whether completed that year (V1311; V1312) and whether the individual has a GED (V1313; V1314; V1315).

Sample Weight: Final sample weight (V2067)

## 3. SURVEY OF INMATES IN LOCAL JAILS (SILJ)

Source: http://www.icpsr.umich.edu/NACJD/
Description: The Survey of Inmates in Local Jails is a nationally representative sample of inmates being held in local jail facilities while awaiting trial conducted for the Bureau of Justice Statistics by the U.S. Census Bureau. The survey has been conducted in 1972, 1978, 1983, 1989 and 1996. All of these samples collected detailed information on basic demographic information, educational attainment, criminal history, sentencing and family backgrounds.

SILJ is a large scale nationally representative sample of all jail inmates in the United States with detailed educational breakdowns of those currently being held. The distinction between GED recipients and high school graduates is not available before 1989.

Sample: This paper uses the 1996 wave of SILJ to estimate the number of inmates by education level currently being held in local jails in the 2000 Census. We use the 1996 wave for this purpose since it is the closest available data in timeframe to the 2000 Census. The 1996 survey sampled a total of 6,133 inmates in 3328 jails who represent a total of 470,263 jail inmates throughout the United States. For our sample, we drop 48 observations for which either age or education is missing resulting in a final sample size of 6,085 .

## Variables:

Age: Age is coded using the variable (BAGE).
Sex: Sex is coded using the variable (S1FRI1).
Race: Four race categories (White; Black, Hispanic, Other) are coded using the variable (RACE).
Education: Education and GED attainment status is coded using the variables (ED) and (ED1).
Sample Weight: Final sample weight (FW) is used in all calculations.

## CALCULATING INCARCERATED GEDS IN 2000

Unlike the Current Population Survey, the 2000 Census sampled those currently living in a variety of group quarters including those currently being held in prisons and jails. The Census only gives the number of high school completers currently incarcerated but we would like to disaggregate GED recipients from this total to assess the impact of excluding the incarcerated population in the CPS surveys. To do so we make use of the SISFCF and SILJ data. We start by first computing the total jail and prison population by age in table A.10. We then multiply these totals by the race totals by facility type shown in table A. 11 which are calculated from 1996 SILJ data and 1997 SISFCF data. This gives the estimated number of inmates by facility type for the
year 2000 shown in table A.12. The estimated educational attainments for inmates in federal, state and jail facilities listed in tables A.14, A. 15 and A.16, respectively are then multiplied by the appropriate table A. 13 estimates to arrive at the final estimates of prisoner educational attainment by race and sex listed in table A.17.

## 4. DEPARTMENT OF DEFENSE DATA (DOD)

Source: http://www.defenselink.mil/prhome/poprep2000/index.htm
Description: Each year the Defense and Manpower Data Center (DMDC) and the U.S. Military Entrance Processing Command (USMEPCOM) collect data on the educational, family background, demographic backgrounds of all incoming military enlistments, or accessions. We use this data to estimate the number of GED credentials among those currently serving in the Armed Forces in the 2000 Census.

The data provide a complete accounting of the educational characteristics of all incoming military personnel in a given year and also separates GED recipients from high school graduates in the calculations. This only provides an approximation of the number of GED recipients ages $20-24$ serving in the military in the 2000 Census since it provides the educational accounting of the flow of incoming recruits and not the total stock. However, this bias is very small in nature since only $5 \%$ of all new accessions have a GED and the total number of GED recipients in the military is few.

Sample: We use the 2000 DMDC report "Population Representation in the Military Services". The DMDC does not provide raw unedited variables so we rely on the calculations of the educational breakdown of all military accessions provided by this agency and shown in table A.18.

## CALCULATION OF GED RECIPIENTS IN ARMED FORCES

We use the percentage GED recipients of the total military accessions in 2000 from table A. 18 to compute the total number of military GED recipients in the 2000 Census ages 20-24. The details of these calculations are shown in table A.19.

## 5. MARCH CURRENT POPULATION SURVEY (CPS MARCH)

Source: http://www.unicon.com and http:// nces.ed.gov/surveys/cps/
Description: The Current Population Survey (CPS) is a monthly survey of approximately 50,000 households that are selected scientifically in the 50 states and the District of Columbia. The CPS has been conducted for more than 50 years by the Census Bureau for the Bureau of Labor Statistics. The CPS collects data on the social and economic characteristics of the civilian, non-institutional population, including information on income, education, and participation in the labor force. Each month, a "basic" CPS questionnaire is used to collect data on participation in the labor force about each member 15 years old and over in every sample household. In addition, supplemental questionnaires are administered to collect information on other topics. In each household, the Bureau seeks information from a knowledgeable adult household member (known as the "household respondent"). That respondent answers all the questions on all of the questionnaires for all members of the household.

The Annual Demographic Survey or March CPS supplement is the primary source of detailed information on income and work experience in the United States. The March CPS is used to generate the annual Population Profile of the United States, reports on geographical mobility and educational attainment, and detailed analyses of money income and poverty status.

Sample: We use the 2000 March supplement to compare estimated totals by education, sex and race to the 2000 Census. These data are available for download from the Unicon website listed above. For the comparisons we restrict the sample to those who are ages 20-24 and 25-29 and who are not currently enrolled in secondary schooling. No other restrictions are placed on the data.

## Variables:

Age: Age is coded using the variable (AGE).

Sex: Sex is coded using the variable (SEX).
Race: Four race categories (White; Black, Hispanic, Other) are coded using the variables (_RACE) and (_SPNETH)..

Education: Education is coded using the variable (GRDATN).
Sample Weight: The 2000 Census based sampling weight, (WGTALT), is used in all calculations.

Estimation: The population totals for the CPS March Supplement compared to the Census data are shown in Table A.20. Note that the CPS March severely underestimates those in the $12^{\text {th }}$ grade no diploma category as noted in the text.

## 6. OCTOBER CURRENT POPULATION SURVEY (CPS OCTOBER)

Source: $\underline{h t t p: / / w w w . u n i c o n . c o m ~ a n d ~ h t t p: / / ~ n c e s . e d . g o v / s u r v e y s / c p s / ~}$
Description: Since 1968, NCES has funded the CPS October Supplement. The October Supplement gathers more detailed data on schooling enrollment and educational attainment among school aged youth. Unlike the CPS March and Census Surveys, in 1988 the CPS October supplement began to distinguish between GED recipients and regular high school graduates. These variables are available for 16-24 year olds from 1988-1992 and 16-29 year olds thereafter.

Sample: We use the CPS October supplement to estimate the race/sex distribution of for civilian noninstitutional GED recipients. We use the CPS October data to estimate these distributions for 20-24 year olds in 1990, 20-24 year olds in 2000 and $25-29$ year olds in 2000 . These data are available for download from the Unicon website listed above. For the estimation we restrict the sample to those who are ages 20-24 and 25-29. No other restrictions are placed on the data. As noted by Kauffman [2000], the GED variable in the CPS

October supplement becomes unreliable after the 1999 survey. For this reason, we use the 1999 survey to estimate the year 2000 totals.

## Variables:

Age: Age is coded using the variable (AGE).
Sex: Sex is coded using the variable (SEX).
Race: Four race categories (White; Black, Hispanic, Other) are coded using the variables (RACE) and (SPNETH).

Education: Education and GED status is coded using the variables (GRDATN), (DIPGED) and (HSGED).

Sample Weight: The final sampling weight, (WGTFNL), is used in all calculations.
Estimation: GED status is coded in the October data as follows. For those who have completed some college or more the variable HSGED is used. For those who have no college and report being a high school graduate, i.e. GRDATN=39, the variable DIPGED is used to code GED status. The estimated distributions of GED recipients by race, sex and birth cohort are listed in A. 21 to A.36. The data sources for the estimates of cohorts not available in the CPS are as listed at the bottom of the table.

## ADMINISTRATIVE DATA

## 7. COMMON CORE OF DATA (CCD)

## Source: http:// nces.ed.gov/ccd/

Description: Common Core of Data (CCD) is the main database of the U.S. government on elementary and secondary public education. The CCD consists of results from five surveys given to the state departments of education that are completed primarily with the data from the state educational agencies (SEAs). This statistical database is published yearly and covers every elementary and secondary public school and school
district, every local education agency, and every state education agency in the United States. The data in CCD are specifically adjusted to be comparable across states. The information provided includes basic information on public schools and school districts (name, phone number, address, type of location), demographic data on pupils and staff members, and fiscal information (current revenue and expenditures).

Sample: We use the 1992-2006 CCD to obtain total high school graduate and enrollment counts by race and sex for the $8^{\text {th }}$ grade estimator. For overall totals not disaggregated by race, and for years prior to 1992, we use the totals reported in various Digests of Education Statistics to obtain diplomas and enrollment counts back to 1963 . Diplomas include only those regular diplomas and not other completers or GED recipients. Diplomas issued and enrollment counts by race are not available prior to 1992. Therefore, it is only possible to calculate the $8^{\text {th }}$ grade estimator by race starting in 1997 and the percentage change from $8^{\text {th }}$ to $9^{\text {th }}$ grades starting in 1993.

Estimation: Total diploma and enrollment counts are listed in Table A.30. For the estimates by race, the following states are not included in all years: Idaho, Kentucky, North Dakota, New Hampshire, South Carolina, Utah, Vermont and Washington due too many missing values in these states or no data at all. Some states had missing values in the time series for certain years. Instead of dropping these states we decided to impute the missing values using linear estimation. The missing values are imputed to be the linear growth rate within that state based on the closest past and future counts in time.

## 8. NATIONAL EDUCATIONAL LONGITUDINAL STUDY (NELS88)

Source: http://nces.ed.gov/surveys/nels88/

Description: The National Educational Longitudinal Study (NELS) started with a sample of $8^{\text {th }}$ graders in 1988 and was conducted by the National Center for Education Statistics (NCES). It is comparable in purpose and design to two studies preceding it - the National Longitudinal Study of 1972 and High School and Beyond, which surveyed high school seniors (both) and sophomores (High School and Beyond only) through high school, postsecondary education, work, occupational choices, and family formation experiences. NELS88 is broader in scope and time span than these other studies. In the 1988 base year, the study surveyed 24,599 eighth grade students from over 1000 public and private schools across the United States.

The NCES used two different phases to select the original sample members for NELS. In the first phase, NELS selected schools. Students within those schools were then sampled in the second phase. NELS used a stratified sample design, and each stratum consisted of schools with similar attributes in specified areas and schools were picked independently within every stratum. Also, there were two different levels of strata: super-strata and sub-strata. Super-strata grouped schools based on school type and region of the country. The sub-strata level then divided the super-strata based on urban status and racial composition. ${ }^{3}$

Additional data gathered from parents, teachers, and school principals supplement the student surveys. The topics include student family background, parental background and income, national origin and native language, cognitive test results, parental interaction with schools, detailed secondary school and student body characteristics, and teacher background. A sub-sample of the original cohort of $8^{\text {th }}$ graders was again resurveyed in $1990,1992,1994$, and for the last time in 2000 . These are known as the first follow-up, the second follow-up, the third follow-up, and the fourth follow-up, respectively.

The NELS data were subject to a wide variety of non-random sampling from the original cohort through the fourth follow-up in the year 2000. First, the selection of schools was not a random process due to a number of choices made by NCES. Private schools were over-sampled relative to public schools. Within private schools, particular types were over-sampled due to some analysts' specific interest in them.

Furthermore, the selection of students within schools was also nonrandom since Asian/Pacific Islander and

Hispanic students were over-sampled within schools. Lastly, those students who were listed by school administrators as learning disabled, physically disable or mentally challenged were excluded from the base year selection process. Those excluded for this reason were disproportionately minority males (See Figure S.8). It was thought that the testing battery given to all NELS respondents in the base year would cause undue burden on these students (See Ingels and Quinn [1996] for a more extensive analysis of base year ineligibles). It was also found that this base year excluded sample had significantly lower levels of educational attainment and higher dropout rates by the second follow-up (See Figure S.9).

The core base year sample of $8^{\text {th }}$ graders was then selectively retained for the first follow-up survey. Students who dropped out in their base year or students who went to a high school with at least ten other base-year sample members were kept with absolute certainty in the first follow-up survey. Those who did not have at least ten fellow base-year sample members at their respective high school were kept in the sample with a probability between zero and 1 based on the number of sample members at their school. Students who transferred between the first and second waves were also not all followed in order to reduce data collection costs. NELS also "freshened" the sample by adding students to the sample who were not enrolled in $8^{\text {th }}$ grade in 1988 who were found to be enrolled in $10^{\text {th }}$ grade in 1990 . This was done in order to obtain a correct probability sample of students enrolled in $10^{\text {th }}$ grade in 1990 and to make the data comparable to the previous HSB survey.

All students who were in the first-follow up survey were kept for the second follow-up sample. Once again, a "freshened" sample was added sample. These were students who were not enrolled in $10^{\text {th }}$ grade in 1990 that were enrolled in $12^{\text {th }}$ grade in 1992.

The sample members for the third follow-up were again a non-randomly selected sub-sample of the second follow-up due primarily to the necessity to cut down on data collection costs. At the same time, the NCES was concerned both with maintaining adequate numbers of sample members with research-precious characteristics and with sustaining a sufficiently high response rate to the questionnaire since most sample
members were no longer enrolled in high school. In order to succeed in all of these aims, NELS separated the sample members from the second follow-up into eighteen groups by "response history, dropout status, eligibility status, school sector type, race, test scores, SES, and freshened status." ("Base Year to Fourth Follow-up Data File User's Manual", p.58) If a participant qualified for multiple groups, the individual was assigned to the first group for which he or she qualified since the groups were listed by order of importance. Every group received an overall selection probability. Groups with few sample members and groups of particular research import received high sub-sampling rates, varying from 6 to 1 . Groups composed of those with low response rates received low sub-sampling probabilities, ranging from .15 to .3. The third follow-up weights were then adjusted to account for this non-random sampling procedure.

The fourth-follow up further reduced the sample size in order to again reduce costs. The same sampling scheme of the third follow-up was used with two additional caveats. For the fourth follow-up, NCES wanted to control for the effects of unequal weighting, which was not accounted for in the third follow-up. In order to correct for this, NCES studied two optimization models. One model minimized survey cost with constraints on "the overall unequal weighting effect, the weighted overall response percentage, and minimum sample sizes in specified domains". ("Base Year to Fourth Follow-up Data File User's Manual", p. 62) The other model minimized overall unequal weighting with constraints on weighted overall response percentage and the least amount of sample members in specified domains. These models estimated the sub-sampling rates for the eighteen groups used to sub-sample the third follow-up survey. In the end, NCES found that the best method was to alternate between the models, although NELS provides no details on exactly how they alternated. Within the groups, sample member's selection probabilities were weighted by third follow-up weights. Furthermore, NCES conducted a second subsampling routine in order to secure a high enough response percentage among particularly research important groups, these include dropouts and the races Asian/Pacific Islander, American Indian/Alaska

Native, Hispanic, non-Hispanic Black, non-Hispanic White. This sub-sample succeeded in raising the response rates of these vital groups.

The NELS target population also changed from the third to the fourth follow-up. For the first time, the institutionalized population was excluded from the sample (See "Base Year to Fourth Follow-up Data File User's Manual", p.100). This tends to impart a severe bias to minority male graduation rates.

Sample: We originally used the fourth follow-up survey to compute the final high school graduation rate for the NELS cohort. The fourth follow-up (F4) has an unweighted sample size of 12,144 subjects, thus retaining only $49.4 \%$ of the original cohort of $24,5998^{\text {th }}$ graders. The included sample needed to have valid responses to the basic F4 race, sex and education variables. The fourth-follow up was found to be biased for computing graduation rates due to the exclusion of institutionalized populations. Therefore, for the final calculation in the text, the NELS third follow-up (F3) was used. The third follow-up has an unweighted sample size of 14,915 cases. Again, the included sample needed to have valid responses to the basic F3 race, sex and education variables listed below.

## Variables:

## F4 CALCULATIONS

High School Diploma/GED Status: We use the variable (F4HSTYPE) to determine high school completion status in F4. GED recipients are counted as dropouts.

Sex: Reported gender in F4 (F4SEX).
Race: Reported race in F4 (F4RACE).
Weight: We use the base-year to fourth follow-up panel weight (F4BYPNWT) for all graduation calculations. This weights target population is all $8^{\text {th }}$ graders who were sampled in F4 regardless of status in F1, F2 and F3.

## F3 CALCULATIONS

High School Diploma/GED Status: We use the variable (F3DIPLOM) to determine high school completion status in F3. GED recipients are counted as dropouts.

Sex: Gender is coded using (F3SEX).
Race: Race/ethnicity is coded using (F3RACE).
Universe: The variable (F3UNIV2A) is used to determine the sample status of each respondent. The possible samples are: Base Year Eligible; Base Ineligible; Freshened F1; and Freshened F2. In some calculations it is necessary to exclude certain samples e.g. excluding freshened samples for calculating the $8^{\text {th }}$ grade cohort graduation rate.

Weight: We use the base-year to fourth follow-up panel weight (F4BYPNWT) for all graduation calculations. This weights target population is all $8^{\text {th }}$ graders who were sampled in F4 regardless of status sample in F1, F2 and F3.

Estimation: The NELS sample design is complex and allows for a number of possible graduation estimators. These various estimators are shown in Table 2 in the text. For the base year ineligible sample we do not have final high school completion status. We do know the educational status for a sample of base year ineligibles in the second follow-up in 1990 when they were supposed to be seniors. By senior year, only $62 \%$ of the ineligibles were enrolled in school and of these, only $42.4 \%$ were enrolled in the expected grade ( $\left.12^{\text {th }}\right)$. To correct for the bias resulting from excluding the base-year ineligible sample, we assume that $50 \%$ of these ineligibles ever graduate from high school and that all of those who reported being in sequence in F2 graduated on-time. We feel these are conservative estimates given the reported educational status of this sample in the second follow-up.

## 9. HIGH SCHOOL AND BEYOND SOPHOMORE COHORT

Source: http:// nces.ed.gov/surveys/hsb/
Description: The High School and Beyond Sophomore Cohort (HSB) data set provides a valuable source of panel information on 27,204 sophomores. When weighted, there are $3,780,927$ subjects in the base year, and

3,275,408 in the fourth follow-up. The base year survey was conducted in spring 1980. Three follow-up surveys were conducted in 1982, 1984, and 1992. The study design provided for a stratified national probability sample of over 1100 secondary schools as the first stage selection. In the second stage, 36 sophomores were selected in each school. Public schools with high percentages of Hispanic students, Catholic schools with high percentages of minority group students, alternative public schools and private schools with high-achieving students were over sampled. Individuals were asked about their family background, ethnicity, schooling histories, and labor force histories.

The HSB data are valuable because they give us another data source for cohorts born around the time of the NLSY79 survey covered and provide very detailed schooling histories and educational attainment measures. A major weakness of the HSB data is that the survey sample starts with students who are enrolled in the $10^{\text {th }}$ grade in 1980 . This sample design will tend to overstate high school graduation rates since those who dropped out prior to reaching $10^{\text {th }}$ grade will be excluded.

Sample: We use the fourth follow up survey to compute final high school graduation rates for the HSB sophomore cohort. The fourth follow up has a total of 12,640 individuals, or $46 \%$ of the original sample. For our final sample we delete $1.5 \%$ of the sample with a missing value for the race/gender variable.

## Variables:

High School Diploma/GED Status: We use the HSB variable (HSDIPGED), which gives the percentage of those with Regular Diplomas, GEDs, and Dropouts in 1992.

Sex: We use the HSB variable (SEX).
Race: To get the race of Whites, Blacks, and Hispanics, we use the variable (RACE), which is the Race of the respondent from the fourth follow-up survey.

Race and Sex: To break down the respondents by both race and gender, we use the variable (RACESEX). Weight: We use (WTA000), which is the replicate weight for the follow-up survey in 1992.

Estimation: All graduation rate calculations are estimated using the NCES Data Analysis System (DAS). High school graduation rates are determined using the High school diploma/GED status variable (HSDIPGED) and are weighted using the 1992 replicate weight.

## 10. NATIONAL LONGITUDINAL SURVEY YOUNG MEN ${ }^{4}$

Source: http://www.bls.gov/nls/oldyoungmen.htm
Description: The NLS Young Men survey is a nationally representative sample of 5,225 men who were subject to 12 interviews between 1966 and 1981. The cohort was reduced to 3,398 people by 1981. The sample is meant to represent the civilian, non-institutionalized population of men ages 14-24 as of April 1, 1966, with black populations represented at three times the expected rate to allow statistically reliable estimates for the population. Weights are provided to correct for this over-sampling. These data contain rich measures of work, school, welfare, marital, and fertility histories.

The NLSY young men sample is an older cohort that has comparable demographic and outcome measures to more recent NLSY cohorts. The young men sample was stopped in 1981 due to high sample attrition. Therefore, no GED variable is available in the young men data and GED status must be imputed. GED recipients are assumed to be those who's highest grade completed changes to 12 years of schooling or over after the age of 20 . This imputation technique yields a similar number of GED recipients as are found in the young women data.

Sample: We restrict the sample to those born between 1946 and 1950. This reduces the original sample size to 2,757 individuals. Of these remaining cases, $80(2.9 \%)$ more cases are deleted due to a missing value in high school graduation status. The final observation count of our sample is 2,677 men.

## Variables:

High School/GED Status: Coded from the highest grade completed and whether currently enrolled variables.

Race: Coded from the 1966 race variable. Hispanic ethnicity is determined from mother and fathers nationality.

Weight: The 1966 sampling weight is used in all calculations.

Estimation: The high school graduation rate is calculated using the 1966 survey weight and is the fraction of the total cohort with a regular high school diploma.

## 11. NATIONAL LONGITUDINAL SURVEY OF YOUNG WOMEN

Source: http://www.bls.gov/nls/nlsorig.htm

## Description:

The original Young Women's cohort of 5159 females ages 14 to 24 who have been interviewed annually and biennially since1968. The sample is meant to represent the civilian, non-institutionalized population of women ages 14-24 as of April 1, 1968, with black populations represented at three times the expected rate to allow statistically reliable estimates for the population. Weights are provided to correct for this over-sampling. These data contain rich measures of work, school, welfare, marital, and fertility histories.

The NLSY young women sample is an older cohort that has comparable demographic and outcome measures to more recent NLSY cohorts. The sample has been followed until the latest wave in 2003. Sample: We restrict the sample to those born between 1946 and 1950. This reduces the original sample size to 2,520 individuals. Of these remaining cases, $63(2.5 \%)$ more cases are deleted due to a missing value in high school graduation status. The final observation count of our sample is 2,457 men.

## Variables:

High School/GED Status: Coded from the highest grade completed; current enrollment and GED attainment variables.

Race: Coded from the 1968 race variable. Hispanic ethnicity is determined from mother and fathers nationality.

Weight: The 1968 sampling weight is used in all calculations.

Estimation: The high school graduation rate is calculated using the 1968 survey weight and is the fraction of the total cohort with a regular high school diploma.

## 12. NATIONAL LONGITUDINAL SURVEY OF YOUTH (1979)

Source: http://www.bls.gov/nls/nlsy79.htm
Description: The NLSY79 includes both a randomly chosen sample of 6,111 U.S. youth and a supplemental sample of 5,295 randomly chosen Black, Hispanic, and non-Black non-Hispanic economically disadvantaged youths. Both of these samples are drawn from the civilian population. In addition, there is a small sample of individuals $(1,280)$ who were enrolled in the military in 1979. All youths were age 13-20 in 1978 and were interviewed annually beginning in 1979 and then biennially starting in 1994. The NLSY79 data contain a rich variety of measures on family background, schooling histories, work histories, welfare histories, marital and fertility choices, and geographic location in each year.

Sample: Our samples consist of both males and females who were in the random sample, the Black supplemental sample, and the Hispanic supplemental sample. This results in a sample of 9,762 youths. We lose 254 sample members ( $2.6 \%$ ) for whom high school educational attainment is unknown. This results in a final sample of 4,796 female and 4,712 male youths.

## Variables:

High School/GED Status: Determined by the 1979-2000 variables: HS Diploma or GED; enrollment as of May $1^{\text {st }}$ key variable and highest grade completed as of May $1^{\text {st }}$ key variable.

Race: Coded from the NLSY79 key sample selection variable.
Sex: Coded from the NLSY79 key sample selection variable.
Weight: The 1979 base year sample weight is used in all calculations.

Estimation: The high school graduation rate is calculated using the 1979 survey weight and is the fraction of the total cohort with a regular high school diploma.

## 13. NATIONAL LONGITUDINAL SURVEY OF YOUTH (1997)5

Source: http://www.bls.gov/nls/nlsy97.htm
Description: The survey documents the transition from school to work of 8,894 individuals. Two subsamples comprise the NLSY97 cohort: 6,748 respondents representative of people living in the United States in 1997 who were born during the years 1980-1984, and 2,236 respondents designed to over-sample black and Hispanic people living in the US during the same period as the cross-sectional sample. Information was gathered from a youth questionnaire, parent questionnaire, screener/household informant questionnaire, household income updates, and school and transcript surveys.

Sample: Our sample consists of all youths contained in both the cross-section sample and the over-sample. This results in a total of 8,984 youths born from 1980 to 1984 . We delete 372 cases ( $4.14 \%$ ) for which high school graduation status could not be coded. The resulting final sample contains 6,493 members of the crosssectional sample and 2,119 members of the black and Hispanic over-sample.

## Variables:

High School/GED Status: Coded from the following variables: highest degree ever completed (key variable); current enrollment status (key variable); reason left school (transcript survey); and ever received a GED (Ed Status and Attainment).

Race: Coded from the 1997 race and ethnicity key variable.

Sex: Coded from the 1997 gender key variable.
Weight: The 1997 round 1 sampling weight is used in all calculations.

Estimation: The high school graduation rate is calculated using the 1997 survey weight and is the fraction of the total cohort with a regular high school diploma.

## 14. NATIONAL SURVEY OF FAMILIES AND HOUSEHOLDS (NSFH)

Source: http://www.ssc.wisc.edu/nsfh/
Description: The NSFH is a national probability sample of 13,007 respondents first administered in 1987. The data include a cross-sectional sample of 9,637 households plus an over-sampling of blacks, Puerto Ricans, Mexican Americans, single-parent families, families with step-children, cohabiting couples and recently married persons. The first wave was in 1987-88, the second in 1992-94 and the third in 2001-02.

At NSFH1, one adult per household was randomly selected and interviewed as the primary respondent. In addition, a self-administered questionnaire was given to the spouse or cohabiting partner of the primary respondent. At NSFH2, original respondents, current spouses/cohabiting partners, and NSFH1 spouses/partners for relationships that had ended were interviewed. In addition, groups of "focal children," who were ages 13-18 at NSFH1 and 18-23 at NSFH2, and who were 5-12 and 10-17, were given two different interviews.

Sample: Our NSFH sample is restricted to those born from 1946-1965 for whom we have valid responses for the variables listed below. We use only the first wave of data or NSFH1.

## Variables:

HS Completion Status: High school completion status is determined using whether an individual has a high school diploma (M507) and GED status (M509 and M510).

Race: Coded using the variable (M484).

Sex: Coded using the variable (M2DP01).
Year of Birth: Coded from the variable (M485M).
Weight: All calculations are weighted using the individual case weight (WEIGHT).

Estimation: Weighted graduation rates are estimated for the following four NSFH birth cohorts by sex and race: 1946-1950, 1951-1955, 1956-1960 and 1961-1965.

## 15. NATIONAL LONGITUDINAL STUDY OF ADOLESCENT HEALTH (ADD HEALTH)

## Source: http://www.cpc.unc.edu/addhealth

Description: The National Longitudinal Study of Adolescent Health (Add Health) is a school-based study of the health-related behaviors of adolescents in grades 7 to 12. It is designed to explore the causes of these behaviors with an emphasis on the influence of social context. Add Health surveys how family, friends and school play roles in the lives of adolescents that may lead to unhealthy, self-destructive behaviors.

Adolescents were interviewed at two points in time, first at Wave I (4/95-12/95) and then a year later at Wave II (4/96 - 8/96). 90,000 questionnaires were asked during the 1994-1995 school year. 20,000 of these students and their parents were interviewed in their homes during the summer of 1995 and 1996. In 2001 and 2002, Add Health respondents, 18 to 26 years old, were re-interviewed in a third wave to investigate the influence that adolescence has on young adulthood.

Add Health provides a comprehensive view of the health and health behaviors of adolescents including self-esteem, suicide indication, violent behaviors, substance use and abuse, sexual behavior and contraceptive use. It also has detailed information on child's schooling attendance, skipping and getting held back in school, getting suspended or expelled from school. In addition to that, detailed information on the grades the child receives at school is also available.

Sample: We restrict the sample to only those children who were enrolled in $7^{\text {th }}$ or $8^{\text {th }}$ grade in the first survey year in order to avoid biasing the sample by missing those who already dropped out in the $9^{\text {th }}, 10^{\text {th }}, 11^{\text {th }}$ and $12^{\text {th }}$ grade samples.

## Variables:

HS Completion Status: High school completion status is determined by using the third follow-up variables for highest grade completed (HG_COMPW3), GED status (GED_W3) and whether or not the respondent holds a high school degree (HSDEG_W3).

Race: From Wave I in-home survey variable (H1GI4)
Sex: From Wave I in-home survey variable (BIO_SEX)
Year of birth: From Wave I in-home survey variables (H1GI1Y and H1GI1M).
Weight: All calculations are weighted using the variable (GSWGT3_2).

Estimation: The graduation rate reported for ADDHEALTH is the fraction of $7^{\text {th }}$ and $8^{\text {th }}$ graders in the first wave who report having a regular high school diploma by the third wave. This will tend to slightly underestimate the overall graduation rates for this cohort, particularly for minorities, because this sample is only ages 19-20 by the third wave. This likely account's for the small observed differences between the NLSY97 and ADDHEALTH calculations.

## Notes

${ }^{1}$ For more information see: (http://usa.ipums.org/usa/intro.shtml\#universe).
${ }^{2}$ The Census Bureau provided imputations for missing values in age, race, sex or educational attainment are used throughout the analysis. Excluding imputed values does not change the conclusions we reach in the paper.
${ }^{3}$ Private schools, however, were not divided into sub-strata based on race.
4 Information based on NLS Handbook, 2000.
${ }^{5}$ Information obtained from NLSY97 User's Guide online at http://www.bls.gov/nls/97guide/nls97usg.htm

## Part B. Supplemental Tables/Figures

The following is a list of tables and figures referenced in the text but not shown in the main body of the text.

## Tables:

Table S. 1 Comparison of GED Credentials Issued using GEDTS data vs. Independent Sample Estimates
Table S. 2 GED Credentials Issued in Correctional Institutions as a Percentage of the Total Issued
Table S. 3 Male Graduation Estimator Comparison in NELS vs. CCD
Table S. 4 Female Graduation Estimator Comparison in NELS vs. CCD

## Figures:

Figure S. $1 \quad$ Percent Change in the Relative Weekly Wages of HS Dropouts to HS and Four Year College Graduates, March CPS

Figure S. 2 Residual of Average Age of GED Recipients Regressed on the Percentage of the U.S. Population Ages 20-24, GEDTS 1959-2001

Figure S. 3 GED Credentials Issued as a Percentage of All High School Completers, NCES and GEDTS
Figure S. 4 Incarcerated Population per 100,000 U.S. Residents by Race, 1925-2004
Figure S. 5 Non-Prior Service Active Component Enlisted Accessions with High School Diplomas by Service with Civilian Comparison Group, FYs 1973-2000

Figure S. 6 Legal and Illegal Immigration into the U.S. as a Fraction of Total Population, 1960-1999
Figure S. $7 \quad$ CPS vs. Census Coverage Rate Comparisons of 20-29 Year Olds by Race and Sex, 1990
Figure S. $8 \quad$ Race/Sex Distribution of Base Year Ineligibles vs. Full Sample (Eligible and Ineligible)
Figure S. 9 Educational Attainment by the Second Follow Up (F2) of Base Year Ineligibles vs. Full Sample (Eligible and Ineligible), NELS

Table S. 1 Comparison of GEDs Issued using GEDTS data vs. Independent Sample Estimates

| Birth Cohort | $1951-1955$ | $1956-1960$ | $1961-1965$ | $1966-1970$ | $1971-1975$ | $1976-1980$ | $1980-1984$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Year | 1980 | 1980 | 1990 | 1990 | 2000 | 2000 | 2004 |
| Age | $25-29$ | $20-24$ | $25-29$ | $20-24$ | $25-29$ | $20-24$ |  |
| GEDTS Estimate | $1,004,323$ | $1,025,369$ | $1,740,018$ | $1,040,537$ | $1,587,737$ | $1,389,540$ |  |
| Independent Data Estimate | na | 983,762 | $1,872,896$ | 933,982 | $1,484,432$ | $1,355,106$ | $1,730,665$ |

[^0]Note: Authors calculations from various data sources. GEDTS estimate is calculated from GEDTS statistical reports using the methodology described in the data appendix. Independent data estimates are from the following sources: (1) 1980-1984 birth cohort-NLSY97 2004 survey; (2) 1976-1980 birth cohort-October CPS 1999 survey; (3) 1971-1975 cohort-October CPS 1999 survey; (4) 1966-1970 cohort-October CPS 1990 survey; (5) 1961-1965 cohort- NLSY79 1960-1964 birth cohort sample; (6) 1956-1960 estimates from NLSY79 1957-1960 birth cohort sample; (7) 1951-1955 cohort estimates from PSID 1990 sample (in order to include Latino sample). Respondents were between the ages of 29 and 35 but the year of GED attainment was restricted to be less than or equal to 1980 .

Table S. 2 GED Credentials Issued in Correctional Institutions as A Percentage of Total Issued

| Year | Coverage | State Prisons | Federal Prisons | Total |
| :--- | :---: | :---: | :---: | :---: |
| 1994 | $57.1 \%$ | $6.7 \%$ | $1.4 \%$ | $8.1 \%$ |
| 1995 | $71.9 \%$ | $8.6 \%$ | $1.2 \%$ | $9.8 \%$ |
| 1996 | $72.5 \%$ | $9.2 \%$ | $1.2 \%$ | $10.4 \%$ |
| 1997 | $73.1 \%$ | $9.4 \%$ | $1.4 \%$ | $10.8 \%$ |
| 1998 | $76.2 \%$ | $9.6 \%$ | $1.4 \%$ | $11.0 \%$ |
| 1999 | $75.4 \%$ | $9.8 \%$ | $1.5 \%$ | $11.3 \%$ |
| 2000 | $79.5 \%$ | $9.8 \%$ | $1.6 \%$ | $11.4 \%$ |
| 2001 | $55.9 \%$ | $7.9 \%$ | $1.6 \%$ | $9.5 \%$ |
| 2002 | $58.0 \%$ | $11.3 \%$ | $1.7 \%$ | $13.0 \%$ |
| 2003 | $58.4 \%$ | $10.2 \%$ | $1.6 \%$ | $11.8 \%$ |
| 2004 | $67.3 \%$ | $11.0 \%$ | $1.8 \%$ | $12.8 \%$ |
| 2005 | $60.5 \%$ | $11.8 \%$ | $1.8 \%$ | $13.6 \%$ |

Sources: Various state Department of Corrections and GED offices. Data for federal prisoners from GED Testing Service "Who took the GED?" various years. See appendix for data for each state considered in the estimation.
Notes: State coveragere represents the total number of GED credentials issued in those states with information available as a percentage of total GEDcredentials issued int he US.Total percentage of GED credentials issued in state prisons represent credentials issued in correctional institutions of those states that have prison information for a given year as a percentage of total GED credentials issued in those states. The percentage of GED credentials issued in federal prisons is calculated on total credentials issued in the US (including federal prisons). Credentials issued in insular areas,freely associated states, Canada, overseas locations and military bases are excluded.

Table S.3. Male Graduation Estimator Comparison in NELS vs. CCD

| A. Overall | NELS |  |  |  |  |  |

| 8th grade Estimator | 69.08\% | 35.03\% | 66.12\% | ... | ... | 71.00\% |
| On time Cohort | 71.00\% | 36.00\% | 67.96\% | 41.78\% | 91.78\% | 66.55\% |

*Inelegible attrition is assumed to be the same as the base year eligible cohort.
** Total sample inlcudes private school students estimated from CPS.

Note: Computed from NELS88 Base Year to Third Follow up. 1992 graduates for inleigibles assumes all in sequence inelgibles in 1992 graduated that year. Bias in 8th Grade Estimator is a function of cohort sizes, retention rates, change in grad rates between cohorts and early graduation among other factors. The "Freshened F1" sample are those who were not enrolled in 8th grade in the base year who were found to be enrolled in 10th grade in the firs follow-up (F1). Likewise, the F2 freshened sample are those not enrolled in 10th grade during the first follow up in 1990 who were enrolled in 12th grade in the second follow-up in 1992 (F2). Final estimates are based on the third follow-up in 1994 (F3).

Table S.4. Female Graduation Estimator Comparison in NELS vs. CCD

| A. Overall | NELS |  |  |  |  |  |

*Inelegible attrition is assumed to be the same as the base year eligible cohort.
** Total sample inlcudes private school students estimated from CPS.

Note: Computed from NELS88 Base Year to Third Follow up. 1992 graduates for inleigibles assumes all in sequence inelgibles in 1992 graduated that year. Bias in 8th Grade Estimator is a function of cohort sizes, retention rates, change in grad rates between cohorts and early graduation among other factors. The "Freshened F1" sample are those who were not enrolled in 8th grade in the base year who were found to be enrolled in 10th grade in the firs follow-up (F1). Likewise, the F2 freshened sample are those not enrolled in 10th grade during the first follow up in 1990 who were enrolled in 12th grade in the second follow-up in 1992 (F2). Final estimates are based on the third follow-up in 1994 (F3).

Figure S.1. Percent Change in the Relative Weekly Wages of HS Dropouts to HS and Four Year College Graduates, March CPS

■ Dropout vs. High School
© Dropout vs. College Graduates

Source: Autor, Katz and Kearney (2005), "Trends in U.S. Wae Inequality: Reassessing the Revisionists". Based on full time - full year workers. High school graduates are those without any post-secondary education. College graduates are those who hold at least a four year college degree.

Figure S.2. Residual of Average Age of GED Recipients Regressed on the Percentage of the U.S.
Population Ages 20-24, GEDTS 1959-2001*

SOURCE: American Council on Education, General Educational Development Testing Service Statistical Reports. Graph plots the residual of regressing average age of GED receipt on a 4-degree polynomial of the percentage of the U.S. population ages 18-24.
*The graph plots the residual $U(t)$ from the regression of the average age of GED recipients $=\alpha+\beta$ (percent of population 20-24) $+U(t)$. " $U(t)$ " is the average age at year $t$ controlling for percent of people age 20-24. The downward drift in $U(t)$ means that the average test-taking age is declining.

Figure S.3. GED Credentials Issued as a Percentage of All High School Completers, NCES and GEDTS

SOURCE: Public and private high school graduate totals from NCES Digest of Educational Statistics (2005) Table 101; GED Credentials Issued from GED Statistical Reports (Various Years).
NOTE: The figure plots proportion of GEDs issued each year over the number of high school completers that year (high school graduates and GED recipients).

Figure S.4. Incarcerated Population per 100,000 U.S. Residents by Race, 1926-2004

SOURCE: Bureau of Justice Statistics and the U.S. Census Bureau. Based on U.S. Census Bureau estimated resident population, as of December 31 . Includes all persons under jurisdiction of federal and state authorities rather than those in the custody of such authorities. Represents inmates sentenced to minimum term of more than a year.

Notes: Author's calculations based on Census 2000 data. All estimates are weighted by the person weight(perwt) and race categories are mutually exclusive. Those reporting never having attended school are excluded. Total GED recipients are estimated GED testing service data. The recent immigrant category are only those who are in the civilian non-institutional population and who emigrated to the U.S. after 1990. The percentage of GEDs who are recent immigrants is estimated from CPS October 2000 data. See the Web Appendix for details of these calculations.

Notes: Author's calculations based on Census 1990 data. All estimates are weighted by the person weight(perwt) and race categories are mutually exclusive. Those reporting never having attended school are excluded. Total GED recipients are estimated GED testing service data. The recent immigrant category are only those who are in the civilian non-institutional population and who emigrated to the U.S. after 1974.

Notes: Author's calculations based on Census 1980 data. All estimates are weighted by the person weight(perwt) and race categories are mutually exclusive. Those reporting never having attended school are excluded. Total GED recipients are estimated GED testing service data. The recent immigrant category are only those who are in the civilian non-institutional population and who emigrated to the U.S. after 1964.

Notes: Author's calculations based on Census 2000 data. All estimates are weighted and race categories are mutually exclusive. Total GED recipients are estimated GED testing service data. The recent immigrant
category are only those who are in the civilian non-institutional population and who emigrated to the U.S. after 1990. The percentage of GEDs who are recent immigrants is estimated from CPS October 2000 data. category are only those who are in the civilian non-institutional population and who emigrated to the U.S. after 1990. The percentage of GEDs who are recent immigrants is estimated from CPS October 2000 data. Estimates of GEDs who are incarcerated or in the military are obtained from BJS and DOD data, respectively. See Appendix A for details of these calculations.

| College Experience (Part of Tier 1) (b) | 7.4 | 4.9 | 1.6 | 14.3 | 6.5 | 46.1 |

Source: Service data are from OASD(FMP)(MPP)/Accession Policy-submitted in accordance with DoD Instruction 7730.56.
USMC college experience data are from DMDC's USMEPCOM Edit File. Civilian data are from Bureau of Labor Statistics Current
Population Survey File, October 1999 - September 2000.

Columns may not add to total due to rounding.

* Civilian numbers and percentages combine Tiers 1 and 2 as civilian data include GED certificates with high school graduate rates.
** Tier 1 data calculated excluding GED+ participants from total accessions. GED+ is an experimental program enlisting up to 4,000 active duty Army applicants with a GED or no credential who have met special screening criteria for enlistment.
${ }^{1}$ Service data from OASD (FMP)(MPP)/Accession Policy have been reviewed and updated by the Services for official submission.
Data presented in this table may differ slightly from the data shown in appendix tables that are taken from DMDC's USMEPCOM Edit File.
${ }^{2}$ College experience data from the Services are defined as those individuals with the following credentials: associate degree,
professional nursing diploma, baccalaureate, master's, post master's, doctorate, first-professional, or completed one semester of college.
Also see Appendix Tables B-7 (Education by Service and Gender) and B-8 (Education by Service and Race/Ethnicity).

*Independent estimate does not include recent immigrants GEDs who entered the U.S. after the initial survey.
** Independent estimate does not include incarcerated GED recipients

Note: Authors calculations from various data sources. GEDTS estimate is calculated from GEDTS statistical reports using the methodology described in the data appendix. Independent data estimates are from the following sources: (1) 1980-1984 birth cohort-NLSY97 2004 survey; (2) 1976-1980 birth cohort-October CPS 1999 survey; (3) 1971-1975 cohort-October CPS 1999 survey; (4) 1966-1970 cohort-October CPS 1990 survey; (5) 1961-1965 cohort- NLSY79 1960-1964 birth cohort sample; (6) 1956-1960 estimates from NLSY79 1957-1960 birth cohort sample; (7) 1951-1955 cohort estimates from PSID 1990 sample (in order to include Latino sample). Respondents were between the ages of 29 and 35 but the year of GED attainment was restricted to be less than or equal to 1980 .

    "Estimates of the Unauthorized Immigrant Population Residing in the United States: 1990-2000", 2001 Statistical Yearbook of the Immigration and Naturalization
    Service.

[^2]:    Source: Horrigan, Moore, Pedlow and Wolter (2002).

[^3]:    Source: Replicated from Table 1 of "Sample Exclusion in NELS:88, Characteristics of Base Year Ineligible Students." Calculations based on NELS88 second follow up survey data.

[^4]:    Notes: Author's calculations based on Census 1990 data. All estimates are weighted by the person weight(perwt) and race categories are mutually exclusive. Those reporting never having attended school are excluded. Total GED recipients are estimated GED testing service data. The recent immigrant category are only those who are in the civilian non-institutional population and who emigrated to the U.S. after 1980.

[^5]:    Source: Author's calculations based on the 1996 "Survey of Inmates from Local Jails".

[^6]:    Notes: Author's calculations based on CPS and Census data. Those never enrolled were excluded from calculations. All calculations are weighted.
