

Supplement to the paper  
Inference on Winners

Isaiah Andrews      Toru Kitagawa      Adam McCloskey

December 31, 2018

This supplement contains proofs and additional results for the paper “Inference on Winners.” Section A collects proofs for results stated in the main text. Section B contains additional details and derivations for the EWM and threshold regression examples introduced in Section 3 of the paper. Section C constructs procedures that dominate conventional sample splitting as discussed in Section 4.3 of the paper. Section D translates our finite-sample results for the normal model to uniform asymptotic results over large classes of data generating processes. Section E reports additional simulation results for the stylized example of Section 2 of the paper. Section F reports additional simulation results for the EWM simulations discussed in Section 6 of the paper. Finally, Section G reports additional simulation results for the threshold regression simulations discussed in Section 7 of the paper.

## A Proofs

**Proof of Proposition 1** For ease of reference, let us abbreviate  $(Y(\tilde{\theta}), \mu_Y(\tilde{\theta}), Z_{\tilde{\theta}})$  by  $(\tilde{Y}, \tilde{\mu}_Y, \tilde{Z})$ . Let  $Y(-\tilde{\theta})$  collect the elements of  $Y$  other than  $Y(\tilde{\theta})$  and define  $\mu_Y(-\theta)$  analogously. Let

$$Y^* = Y(-\tilde{\theta}) - Cov\left(Y(-\tilde{\theta}), \begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right) Var\left(\begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right)^+ \begin{pmatrix} \tilde{Y} \\ X \end{pmatrix},$$

$$\mu_Y^* = \mu_Y(-\tilde{\theta}) - Cov\left(Y(-\tilde{\theta}), \begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right) Var\left(\begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right)^+ \begin{pmatrix} \tilde{\mu}_Y \\ \mu_X \end{pmatrix},$$

and

$$\tilde{\mu}_Z = \mu_X - \left(\Sigma_{XY}(\cdot, \tilde{\theta}) / \Sigma_Y(\tilde{\theta})\right) \mu_Y.$$

Here we use  $A^+$  to denote the Moore-Penrose pseudoinverse of a matrix  $A$ . Note that  $(\tilde{Z}, \tilde{Y}, Y^*)$  is a one-to-one transformation of  $(X, Y)$ , and thus that observing  $(\tilde{Z}, \tilde{Y}, Y^*)$  is

equivalent to observing  $(X, Y)$ . Likewise,  $(\tilde{\mu}_Z, \tilde{\mu}_Y, \mu_Y^*)$  is a one-to-one linear transformation of  $(\mu_X, \mu_Y)$ , and if the set of possible values for the latter contains an open set, that for the former does as well (relative to the appropriate linear subspace).

Note, next, that since  $(\tilde{Z}, \tilde{Y}, Y^*)$  is a linear transformation of  $(X, Y)$ ,  $(\tilde{Z}, \tilde{Y}, Y^*)$  is jointly normal (with a potentially degenerate distribution). Note next that  $(\tilde{Z}, \tilde{Y}, Y^*)$  are mutually uncorrelated, and thus independent. That  $\tilde{Z}$  and  $\tilde{Y}$  are uncorrelated is straightforward to verify. To show that  $Y^*$  is likewise uncorrelated with the other elements, note that we can write  $Cov(Y^*, (\tilde{Y}, X)')$  as

$$Cov\left(Y(-\tilde{\theta}), \begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right) - Cov\left(Y(-\tilde{\theta}), \begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right) Var\left(\begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right)^+ Var\left(\begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right).$$

For  $V\Lambda V'$  an eigendecomposition of  $Var((\tilde{Y}, X)')$  (so  $VV' = I$ ), note that we can write

$$Var\left(\begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right)^+ Var\left(\begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right) = VDV'$$

for  $D$  a diagonal matrix with ones in the entries corresponding to the nonzero entries of  $\Lambda$  and zeros everywhere else. For any column  $v$  of  $V$  corresponding to a zero entry of  $D$ ,  $v'Var((\tilde{Y}, X)')v = 0$ , so the Cauchy-Schwarz inequality implies that

$$Cov\left(Y(-\tilde{\theta}), \begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right)v = 0.$$

Thus,

$$Cov\left(Y(-\tilde{\theta}), \begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right)VDV' = Cov\left(Y(-\tilde{\theta}), \begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right)VV' = Cov\left(Y(-\tilde{\theta}), \begin{pmatrix} \tilde{Y} \\ X \end{pmatrix}\right),$$

so  $Y^*$  is uncorrelated with  $(\tilde{Y}, X)'$ .

Using independence, the joint density of  $(\tilde{Z}, \tilde{Y}, Y^*)$  absent truncation is given by

$$f_{N, \tilde{Z}}(\tilde{z}; \tilde{\mu}_Z) f_{N, \tilde{Y}}(\tilde{y}; \tilde{\mu}_Y) f_{N, Y^*}(\tilde{y}^*; \mu_Y^*)$$

for  $f_N$  normal densities with respect to potentially degenerate base measures:

$$f_{N,\tilde{Z}}(\tilde{z};\tilde{\mu}_Z) = \tilde{\det}(2\pi\Sigma_{\tilde{Z}})^{-\frac{1}{2}} \exp\left(-\frac{1}{2}(\tilde{z}-\tilde{\mu}_Z)'\Sigma_{\tilde{Z}}^+(\tilde{z}-\tilde{\mu}_Z)\right)$$

$$f_{N,\tilde{Y}}(\tilde{y};\tilde{\mu}_Y) = (2\pi\Sigma_{\tilde{Y}})^{-\frac{1}{2}} \exp\left(-\frac{(\tilde{y}-\tilde{\mu}_Y)^2}{2\Sigma_{\tilde{Y}}}\right)$$

$$f_{N,Y^*}(y^*; \mu_{Y^*}^*) = \tilde{\det}(2\pi\Sigma_{Y^*})^{-\frac{1}{2}} \exp\left(-\frac{1}{2}(y^* - \mu_{Y^*}^*)'\Sigma_{Y^*}^+(y^* - \mu_{Y^*}^*)\right),$$

where  $\tilde{\det}(A)$  denotes the pseudodeterminant of a matrix  $A$ ,  $\Sigma_{\tilde{Z}} = \text{Var}(\tilde{Z})$ ,  $\Sigma_{\tilde{Y}} = \Sigma_Y(\tilde{\theta})$ , and  $\Sigma_{Y^*} = \text{Var}(Y^*)$ .

The event  $\{X \in \mathcal{X}(\tilde{\theta}, \tilde{\gamma})\}$  depends only on  $(\tilde{Z}, \tilde{Y})$  since it can be expressed as

$$\left\{ \left( \tilde{Z} + \frac{\Sigma_{XY}(\cdot, \tilde{\theta})}{\Sigma_Y(\tilde{\theta})} \tilde{Y} \right) \in \mathcal{X}(\tilde{\theta}, \tilde{\gamma}) \right\},$$

so conditional on this event  $Y^*$  remains independent of  $(\tilde{Z}, \tilde{Y})$ . In particular, we can write the joint density conditional on  $\{X \in \mathcal{X}(\tilde{\theta}, \tilde{\gamma})\}$  as

$$\frac{1 \left\{ \left( \tilde{z} + \Sigma_{XY}(\cdot, \tilde{\theta}) \Sigma_Y(\tilde{\theta})^{-1} \tilde{y} \right) \in \mathcal{X}(\tilde{\theta}, \tilde{\gamma}) \right\}}{\text{Pr}_{\tilde{\mu}_Z, \tilde{\mu}_Y} \left\{ X \in \mathcal{X}(\tilde{\theta}, \tilde{\gamma}) \right\}} f_{N,\tilde{Z}}(\tilde{z}; \tilde{\mu}_Z) f_{N,\tilde{Y}}(\tilde{y}; \tilde{\mu}_Y) f_{N,Y^*}(\tilde{y}^*; \mu_{Y^*}^*). \quad (26)$$

The density (26) has the same structure as (5.5.14) of Pfanzagl (1994), and satisfies properties (5.5.1)-(5.5.3) of Pfanzagl (1994) as well. Part 1 of the proposition then follows immediately from Theorem 5.5.9 of Pfanzagl (1994). Part 2 of the proposition follows by using Theorem 5.5.9 of Pfanzagl (1994) to verify the conditions of Theorem 5.5.15 of Pfanzagl (1994).  $\square$

**Proof of Proposition 2** In the proof of Proposition 1, we showed that the joint density of  $(\tilde{Z}, \tilde{Y}, Y^*)$  (defined in that proof) has the exponential family structure assumed in equation 4.10 of Lehmann and Romano (2005). Moreover, Assumption 1 implies that the parameter space for  $(\mu_X, \mu_Y)$  is convex and is not contained in any proper linear subspace. Thus, the parameter space for  $(\tilde{\mu}_Z, \tilde{\mu}_Y, \mu_{Y^*}^*)$  inherits the same property, and satisfies the conditions of Theorem 4.4.1 of Lehmann and Romano (2005). The result follows immediately.  $\square$

**Proof of Proposition 3** Let us number the elements of  $\Theta$  as  $\{\theta_1, \theta_2, \dots, \theta_{|\Theta|}\}$ , where  $X(\theta_1)$  is the first element of  $X$ ,  $X(\theta_2)$  is the second element, and so on. Let us further assume without loss of generality that  $\tilde{\theta} = \theta_1$ . Note that the conditioning event  $\{\max_{\theta \in \Theta} X(\theta) = X(\theta_1)\}$  is equivalent to  $\{MX \geq 0\}$ , where

$$M \equiv \begin{pmatrix} 1 & -1 & 0 & 0 & \dots & 0 \\ 1 & 0 & -1 & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 1 & 0 & 0 & 0 & \dots & -1 \end{pmatrix}$$

is a  $(|\Theta|-1) \times |\Theta|$  matrix and the inequality is taken element-wise. Let  $A = \begin{bmatrix} -M & 0_{(|\Theta|-1) \times |\Theta|} \end{bmatrix}$ , where  $0_{(|\Theta|-1) \times |\Theta|}$  denotes the  $(|\Theta|-1) \times |\Theta|$  matrix of zeros. Let  $W = (X', Y)'$  and note that we can re-write the event of interest as  $\{W : AW \leq 0\}$  and that we are interested in inference on  $\eta' \mu$  for  $\eta$  the  $2|\Theta| \times 1$  vector with one in the  $(|\Theta|+1)$ st entry and zeros everywhere else. Define

$$Z_{\tilde{\theta}}^* = W - cY(\tilde{\theta}),$$

for  $c = Cov(W, Y(\tilde{\theta})) / \Sigma_Y(\tilde{\theta})$ , noting that the definition of  $Z_{\tilde{\theta}}$  in (17) corresponds to extracting the elements of  $Z_{\tilde{\theta}}^*$  corresponding to  $X$ . By Lemma 5.1 of Lee et al. (2016),

$$\{W : AW \leq 0\} = \left\{ W : \mathcal{L}(\tilde{\theta}, Z_{\tilde{\theta}}^*) \leq Y(\tilde{\theta}) \leq \mathcal{U}(\tilde{\theta}, Z_{\tilde{\theta}}^*), \mathcal{V}(\tilde{\theta}, Z_{\tilde{\theta}}^*) \geq 0 \right\},$$

where for  $(v)_j$  the  $j$ th element of a vector  $v$ ,

$$\mathcal{L}(\tilde{\theta}, z) = \max_{j:(Ac)_j < 0} \frac{-(Az)_j}{(Ac)_j}$$

$$\mathcal{U}(\tilde{\theta}, z) = \min_{j:(Ac)_j > 0} \frac{-(Az)_j}{(Ac)_j}$$

$$\mathcal{V}(\tilde{\theta}, z) = \min_{j:(Ac)_j = 0} -(Az)_j.$$

Note, however, that

$$(AZ_{\tilde{\theta}}^*)_j = Z_{\tilde{\theta}}(\theta_j) - Z_{\tilde{\theta}}(\theta_1)$$

and

$$(Ac)_j = -\frac{\Sigma_{XY}(\theta_1, \theta_1) - \Sigma_{XY}(\theta_1, \theta_j)}{\Sigma_Y(\theta_1)}.$$

Hence, we can re-write

$$\frac{-(AZ_{\tilde{\theta}}^*)_j}{(Ac)_j} = \frac{\Sigma_Y(\theta_1)(Z_{\tilde{\theta}}(\theta_j) - Z_{\tilde{\theta}}(\theta_1))}{\Sigma_{XY}(\theta_1, \theta_1) - \Sigma_{XY}(\theta_1, \theta_j)},$$

$$\mathcal{L}(\tilde{\theta}, Z_{\tilde{\theta}}^*) = \max_{j: \Sigma_{XY}(\theta_1, \theta_1) > \Sigma_{XY}(\theta_1, \theta_j)} \frac{\Sigma_Y(\theta_1)(Z_{\tilde{\theta}}(\theta_j) - Z_{\tilde{\theta}}(\theta_1))}{\Sigma_{XY}(\theta_1, \theta_1) - \Sigma_{XY}(\theta_1, \theta_j)},$$

$$\mathcal{U}(\tilde{\theta}, Z_{\tilde{\theta}}^*) = \min_{j: \Sigma_{XY}(\theta_1, \theta_1) < \Sigma_{XY}(\theta_1, \theta_j)} \frac{\Sigma_Y(\theta_1)(Z_{\tilde{\theta}}(\theta_j) - Z_{\tilde{\theta}}(\theta_1))}{\Sigma_{XY}(\theta_1, \theta_1) - \Sigma_{XY}(\theta_1, \theta_j)},$$

and

$$\mathcal{V}(\tilde{\theta}, Z_{\tilde{\theta}}^*) = \min_{j: \Sigma_{XY}(\theta_1, \theta_1) = \Sigma_{XY}(\theta_1, \theta_j)} -(Z_{\tilde{\theta}}(\theta_j) - Z_{\tilde{\theta}}(\theta_1)).$$

Note, however, that these are functions of  $Z_{\tilde{\theta}}$ , as expected. The result follows.  $\square$

**Proof of Proposition 4** Note the following equivalence of events:

$$\begin{aligned} \{\hat{\theta} = \tilde{\theta}\} &= \left\{ \sum_{i=1}^{d_X} X_i(\tilde{\theta})^2 \geq \sum_{i=1}^{d_X} X_i(\theta)^2 \forall \theta \in \Theta \right\} \\ &= \left\{ \sum_{i=1}^{d_X} \left[ Z_{\tilde{\theta}, i}(\tilde{\theta}) + \Sigma_{XY, i}(\tilde{\theta}) \Sigma_Y(\tilde{\theta})^{-1} Y(\tilde{\theta}) \right]^2 \right. \\ &\quad \left. \geq \sum_{i=1}^{d_X} \left[ Z_{\tilde{\theta}, i}(\theta) + \Sigma_{XY, i}(\theta, \tilde{\theta}) \Sigma_Y(\tilde{\theta})^{-1} Y(\tilde{\theta}) \right]^2 \forall \theta \in \Theta \right\} \\ &= \left\{ A(\tilde{\theta}, \theta) Y(\tilde{\theta})^2 + B_Z(\tilde{\theta}, \theta) Y(\tilde{\theta}) + C_Z(\tilde{\theta}, \theta) \geq 0 \forall \theta \in \Theta \right\}, \end{aligned} \quad (27)$$

for  $A(\tilde{\theta}, \theta)$ ,  $B_Z(\tilde{\theta}, \theta)$ , and  $C_Z(\tilde{\theta}, \theta)$  as defined in the statement of the proposition.

By the quadratic formula, (27) is equivalent to the event

$$\left\{ \frac{-B_Z(\tilde{\theta}, \theta) - \sqrt{D_Z(\tilde{\theta}, \theta)}}{2A(\tilde{\theta}, \theta)} \leq Y(\tilde{\theta}) \leq \frac{-B_Z(\tilde{\theta}, \theta) + \sqrt{D_Z(\tilde{\theta}, \theta)}}{2A(\tilde{\theta}, \theta)} \right.$$

$$\forall \theta \in \Theta \text{ s.th. } A(\tilde{\theta}, \theta) < 0 \text{ and } D_Z(\tilde{\theta}, \theta) \geq 0,$$

$$Y(\tilde{\theta}) \leq \frac{-B_Z(\tilde{\theta}, \theta) - \sqrt{D_Z(\tilde{\theta}, \theta)}}{2A(\tilde{\theta}, \theta)} \text{ or } Y(\tilde{\theta}) \geq \frac{-B_Z(\tilde{\theta}, \theta) + \sqrt{D_Z(\tilde{\theta}, \theta)}}{2A(\tilde{\theta}, \theta)}$$

$$\begin{aligned}
& \forall \theta \in \Theta \text{ s.th. } A(\tilde{\theta}, \theta) > 0 \text{ and } D_Z(\tilde{\theta}, \theta) \geq 0, \\
& Y(\tilde{\theta}) \geq \frac{-C_Z(\tilde{\theta}, \theta)}{B_Z(\tilde{\theta}, \theta)} \quad \forall \theta \in \Theta \text{ s.th. } A(\tilde{\theta}, \theta) = 0 \text{ and } B_Z(\tilde{\theta}, \theta) > 0, \\
& Y(\tilde{\theta}) \leq \frac{-C_Z(\tilde{\theta}, \theta)}{B_Z(\tilde{\theta}, \theta)} \quad \forall \theta \in \Theta \text{ s.th. } A(\tilde{\theta}, \theta) = 0 \text{ and } B_Z(\tilde{\theta}, \theta) < 0, \\
& C_Z(\tilde{\theta}, \theta) \geq 0 \quad \forall \theta \in \Theta \text{ s.th. } A(\tilde{\theta}, \theta) = B_Z(\tilde{\theta}, \theta) = 0, \\
& C_Z(\tilde{\theta}, \theta) > 0 \quad \forall \theta \in \Theta \text{ s.th. } D_Z(\tilde{\theta}, \theta) < 0 \} \\
& = \left\{ Y(\tilde{\theta}) \in \bigcap_{\theta \in \Theta: A(\tilde{\theta}, \theta) < 0, D_Z(\tilde{\theta}, \theta) \geq 0} \left[ \frac{-B_Z(\tilde{\theta}, \theta) - \sqrt{D_Z(\tilde{\theta}, \theta)}}{2A(\tilde{\theta}, \theta)}, \frac{-B_Z(\tilde{\theta}, \theta) + \sqrt{D_Z(\tilde{\theta}, \theta)}}{2A(\tilde{\theta}, \theta)} \right] \right. \\
& \quad \cap \bigcap_{\theta \in \Theta: A(\tilde{\theta}, \theta) > 0, D_Z(\tilde{\theta}, \theta) \geq 0} \left( -\infty, \frac{-B_Z(\tilde{\theta}, \theta) - \sqrt{D_Z(\tilde{\theta}, \theta)}}{2A(\tilde{\theta}, \theta)} \right) \cup \left[ \frac{-B_Z(\tilde{\theta}, \theta) + \sqrt{D_Z(\tilde{\theta}, \theta)}}{2A(\tilde{\theta}, \theta)}, \infty \right) \\
& \quad \cap \bigcap_{\theta \in \Theta: A(\tilde{\theta}, \theta) = 0, B_Z(\tilde{\theta}, \theta) > 0} \left[ H_Z(\tilde{\theta}, \theta), \infty \right) \cap \bigcap_{\theta \in \Theta: A(\tilde{\theta}, \theta) = 0, B_Z(\tilde{\theta}, \theta) < 0} \left( -\infty, H_Z(\tilde{\theta}, \theta) \right] \} \\
& \quad \cap \left\{ \min_{\theta \in \Theta: A(\tilde{\theta}, \theta) = B_Z(\tilde{\theta}, \theta) = 0 \text{ or } D_Z(\tilde{\theta}, \theta) < 0} C_Z(\tilde{\theta}, \theta) \geq 0 \right\} \\
& = \left\{ Y(\tilde{\theta}) \in \left[ \max_{\theta \in \Theta: A(\tilde{\theta}, \theta) < 0, D_Z(\tilde{\theta}, \theta) \geq 0} G_Z(\tilde{\theta}, \theta), \min_{\theta \in \Theta: A(\tilde{\theta}, \theta) < 0, D_Z(\tilde{\theta}, \theta) \geq 0} K_Z(\tilde{\theta}, \theta) \right] \right. \\
& \quad \cap \left[ \max_{\theta \in \Theta: A(\tilde{\theta}, \theta) = 0, B_Z(\tilde{\theta}, \theta) > 0} H_Z(\tilde{\theta}, \theta), \infty \right) \cap \left( -\infty, \min_{\theta \in \Theta: A(\tilde{\theta}, \theta) = 0, B_Z(\tilde{\theta}, \theta) < 0} H_Z(\tilde{\theta}, \theta) \right) \\
& \quad \cap \bigcap_{\theta \in \Theta: A(\tilde{\theta}, \theta) > 0, D_Z(\tilde{\theta}, \theta) \geq 0} \left( -\infty, K_Z(\tilde{\theta}, \theta) \right) \cup \left[ G_Z(\tilde{\theta}, \theta), \infty \right) \} \cap \{ \mathcal{V}(\tilde{\theta}, Z_{\tilde{\theta}}) \geq 0 \} \\
& = \left\{ Y(\tilde{\theta}) \in \bigcap_{\theta \in \Theta: A(\tilde{\theta}, \theta) > 0, D_Z(\tilde{\theta}, \theta) \geq 0} \left[ \ell_Z^1(\tilde{\theta}, \theta), u_Z^1(\tilde{\theta}, \theta) \right] \cup \left[ \ell_Z^2(\tilde{\theta}, \theta), u_Z^2(\tilde{\theta}, \theta) \right] \right\} \cap \{ \mathcal{V}(\tilde{\theta}, Z_{\tilde{\theta}}) \geq 0 \}
\end{aligned}$$

for  $D_Z(\tilde{\theta}, \theta)$ ,  $G_Z(\tilde{\theta}, \theta)$ ,  $H_Z(\tilde{\theta}, \theta)$ ,  $K_Z(\tilde{\theta}, \theta)$ ,  $\ell_Z^1(\tilde{\theta})$ ,  $\ell_Z^2(\tilde{\theta}, \theta)$ ,  $u_Z^1(\tilde{\theta}, \theta)$ ,  $u_Z^2(\tilde{\theta})$ , and  $\mathcal{V}(\tilde{\theta}, Z_{\tilde{\theta}})$  again defined in the statement of the proposition. The result follows immediately.  $\square$

**Proof of Lemma 1** Recall that conditional on  $Z_{\tilde{\theta}} = z_{\tilde{\theta}}$ ,  $\hat{\theta} = \tilde{\theta}$  and  $\hat{\gamma} = \tilde{\gamma}$  if and only if  $Y(\tilde{\theta}) \in \mathcal{Y}(\tilde{\theta}, \tilde{\gamma}, z_{\tilde{\theta}})$ . Hence, the assumption of the lemma implies that

$$Pr_{\mu_{Y,m}} \left\{ Y(\tilde{\theta}) \in \mathcal{Y}(\tilde{\theta}, \tilde{\gamma}, Z_{\tilde{\theta}}) \mid Z_{\tilde{\theta}} = z_{\tilde{\theta},m} \right\} \rightarrow 1.$$

Note, next, that both the conventional and conditional confidence sets are equivariant under shifts, in the sense that the conditional confidence set for  $\mu_Y(\tilde{\theta})$  based on observing  $Y(\tilde{\theta})$  conditional on  $Y(\tilde{\theta}) \in \mathcal{Y}(\tilde{\theta}, \tilde{\gamma}, Z_{\tilde{\theta}})$  is equal to the conditional confidence set for  $\mu_Y(\tilde{\theta})$  based on observing  $Y(\tilde{\theta}) - \mu_Y^*(\tilde{\theta})$  conditional on  $Y(\tilde{\theta}) - \mu_Y^*(\tilde{\theta}) \in \mathcal{Y}(\tilde{\theta}, \tilde{\gamma}, Z_{\tilde{\theta}}) - \mu_Y^*(\tilde{\theta})$  for any constant  $\mu_Y^*(\tilde{\theta})$ . Hence, rather than considering a sequence of values  $\mu_{Y,m}$ , we can fix some  $\mu_Y^*$  and note that

$$Pr_{\mu_Y^*} \left\{ Y(\tilde{\theta}) \in \mathcal{Y}_m^* \mid Z_{\tilde{\theta}} = z_{\tilde{\theta},m} \right\} \rightarrow 1,$$

where  $\mathcal{Y}_m^* = \mathcal{Y}(\tilde{\theta}, \tilde{\gamma}, Z_{\tilde{\theta}}) - \mu_{Y,m}(\tilde{\theta}) + \mu_Y^*(\tilde{\theta})$ . Confidence sets for  $\mu_{Y,m}(\tilde{\theta})$  in the original problem are equal to those for  $\mu_Y^*(\tilde{\theta})$  in the new problem, shifted by  $\mu_{Y,m}(\tilde{\theta}) - \mu_Y^*(\tilde{\theta})$ . Hence, to prove the result it suffices to prove the equivalence of conditional and conventional confidence sets in the problem with  $\mu_Y$  fixed (and likewise for estimators).

To prove the result, we make use of the following lemma, which is proved below. First, we must introduce the following notation. Let  $(c_{l,ET}(\mu_{Y,0}, \mathcal{Y}), c_{u,ET}(\mu_{Y,0}, \mathcal{Y}))$  denote the critical values for an equal-tailed test of  $H_0 : \mu_Y(\tilde{\theta}) = \mu_{Y,0}$  for  $Y(\tilde{\theta}) \sim N(\mu_Y(\tilde{\theta}), \Sigma_Y(\tilde{\theta}))$  conditional on  $Y(\tilde{\theta}) \in \mathcal{Y}$ . That is,  $(c_{l,ET}(\mu_{Y,0}, \mathcal{Y}), c_{u,ET}(\mu_{Y,0}, \mathcal{Y}))$  solve

$$F_{TN}(c_{l,ET}(\mu_{Y,0}, \mathcal{Y}); \mu_{Y,0}, \mathcal{Y}) = \frac{\alpha}{2}$$

$$F_{TN}(c_{u,ET}(\mu_{Y,0}, \mathcal{Y}); \mu_{Y,0}, \mathcal{Y}) = 1 - \frac{\alpha}{2},$$

where  $F_{TN}(\cdot; \mu_{Y,0}, \mathcal{Y})$  is the distribution function for the normal distribution  $N(\mu_{Y,0}, \Sigma_Y(\tilde{\theta}))$  truncated to  $\mathcal{Y}$ . Similarly, let  $(c_{l,U}(\mu_{Y,0}, \mathcal{Y}), c_{u,U}(\mu_{Y,0}, \mathcal{Y}))$  denote the critical values for the corresponding unbiased test. That is,  $(c_{l,U}(\mu_{Y,0}, \mathcal{Y}), c_{u,U}(\mu_{Y,0}, \mathcal{Y}))$  solve

$$Pr\{\zeta \in [c_{l,U}(\mu_{Y,0}, \mathcal{Y}), c_{u,U}(\mu_{Y,0}, \mathcal{Y})]\} = 1 - \alpha$$

$$E[\zeta \mathbf{1}\{\zeta \in [c_{l,U}(\mu_{Y,0}, \mathcal{Y}), c_{u,U}(\mu_{Y,0}, \mathcal{Y})]\}] = (1 - \alpha)E[\zeta]$$

for  $\zeta \sim \xi \mid \xi \in \mathcal{Y}$  where  $\xi \sim N(\mu_{Y,0}, \Sigma_Y(\tilde{\theta}))$ .

**Lemma 3**

*Suppose that we observe  $Y(\tilde{\theta}) \sim N(\mu_Y(\tilde{\theta}), \Sigma_Y(\tilde{\theta}))$  conditional on  $Y(\tilde{\theta})$  falling in a set  $\mathcal{Y}$ . If we hold  $(\Sigma_Y(\tilde{\theta}), \mu_{Y,0})$  fixed and consider a sequence of sets  $\mathcal{Y}_m$  such that*

$Pr\{Y(\tilde{\theta}) \in \mathcal{Y}_m\} \rightarrow 1$ , we have that for

$$\phi_{ET}(\mu_{Y,0}) = 1 \left\{ Y(\tilde{\theta}) \notin [c_{l,ET}(\mu_{Y,0}, \mathcal{Y}_m), c_{u,ET}(\mu_{Y,0}, \mathcal{Y}_m)] \right\} \quad (28)$$

and

$$\phi_U(\mu_{Y,0}) = 1 \left\{ Y(\tilde{\theta}) \notin [c_{l,U}(\mu_{Y,0}, \mathcal{Y}_m), c_{u,U}(\mu_{Y,0}, \mathcal{Y}_m)] \right\}, \quad (29)$$

$$(c_{l,ET}(\mu_{Y,0}, \mathcal{Y}_m), c_{u,ET}(\mu_{Y,0}, \mathcal{Y}_m)) \rightarrow \left( \mu_{Y,0} - c_{\frac{\alpha}{2}, N} \sqrt{\Sigma_Y(\tilde{\theta})}, \mu_{Y,0} + c_{\frac{\alpha}{2}, N} \sqrt{\Sigma_Y(\tilde{\theta})} \right)$$

and

$$(c_{l,U}(\mu_{Y,0}, \mathcal{Y}_m), c_{u,U}(\mu_{Y,0}, \mathcal{Y}_m)) \rightarrow \left( \mu_{Y,0} - c_{\frac{\alpha}{2}, N} \sqrt{\Sigma_Y(\tilde{\theta})}, \mu_{Y,0} + c_{\frac{\alpha}{2}, N} \sqrt{\Sigma_Y(\tilde{\theta})} \right).$$

To complete the proof, first note that  $CS_{ET}$  and  $CS_U$  are formed by inverting (families of) equal-tailed and unbiased tests, respectively. Let  $CS_m$  denote a generic conditional confidence set formed by inverting a family of tests

$$\phi_m(\mu_{Y,0}) = 1 \left\{ Y(\tilde{\theta}) \notin [c_l(\mu_{Y,0}, \mathcal{Y}_m^*), c_u(\mu_{Y,0}, \mathcal{Y}_m^*)] \right\}.$$

Hence, we want to show that

$$CS_m \rightarrow_p \left[ Y(\tilde{\theta}) - c_{\frac{\alpha}{2}, N}, Y(\tilde{\theta}) + c_{\frac{\alpha}{2}, N} \right], \quad (30)$$

as  $m \rightarrow \infty$ , for  $CS_m$  formed by inverting either (28) or (29).

We assume that  $CS_m$  is a finite interval for all  $m$ , which holds trivially for the equal-tailed confidence set  $CS_{ET}$ , and holds for  $C_U$  by Lemma 5.5.1 of Lehmann and Romano (2005). For each value  $\mu_{Y,0}$  our Lemma 3 implies that

$$\phi_m(\mu_{Y,0}) \rightarrow_p 1 \left\{ Y(\tilde{\theta}) \notin [\mu_{Y,0} - c_{\frac{\alpha}{2}, N}, \mu_{Y,0} + c_{\frac{\alpha}{2}, N}] \right\}$$

for  $\phi_m$  equal to either (28) or (29). This convergence in probability holds jointly for all finite collections of values  $\mu_{Y,0}$ , however, which implies (30). The same argument works for the median unbiased estimator  $\hat{\mu}_{\frac{1}{2}}$ , which can also be viewed as the upper endpoint of a one-sided 50% confidence interval.  $\square$

**Proof of Proposition 5** We prove this result for the unconditional case, noting that since  $Pr_{\mu_m} \left\{ \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma} \right\} \rightarrow 1$ , the result conditional on  $\left\{ \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma} \right\}$  follows immediately.

Note that by the law of iterated expectations,  $Pr_{\mu_m} \left\{ \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma} \right\} \rightarrow 1$  implies that  $Pr_{\mu_{Y,m}} \left\{ \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma} | Z_{\tilde{\theta}} \right\} \rightarrow_p 1$ . Hence, if we define

$$g(\mu_Y, z) = Pr_{\mu_Y} \left\{ \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma} | Z_{\tilde{\theta}} = z \right\},$$

we see that  $g(\mu_{Y,m}, Z_{\tilde{\theta}}) \rightarrow_p 1$ .

Note, next, that for  $d$  the euclidian distance between the endpoints, if we define

$$h_\varepsilon(\mu_Y, z) = Pr_{\mu_Y} \left\{ d(CS_U, CS_N) > \varepsilon | Z_{\tilde{\theta}} = z \right\},$$

Lemma 1 implies that for any sequence  $(\mu_{Y,m}, z_m)$  such that  $g(\mu_{Y,m}, z_m) \rightarrow 1$ ,  $h_\varepsilon(\mu_{Y,m}, z_m) \rightarrow 0$ . Hence, if we define  $\mathcal{G}(\delta) = \{(\mu_Y, z) : g(\mu_Y, z) > 1 - \delta\}$  and  $\mathcal{H}(\varepsilon) = \{(\mu_Y, z) : h_\varepsilon(\mu_Y, z) < \varepsilon\}$ , we see that for all  $\varepsilon > 0$  there exists  $\delta(\varepsilon) > 0$  such that  $\mathcal{G}(\delta(\varepsilon)) \subseteq \mathcal{H}(\varepsilon)$ .

Hence, since our argument above implies that for all  $\delta > 0$ ,

$$Pr_{\mu_m} \left\{ (\mu_{Y,m}, Z_{\tilde{\theta}}) \in \mathcal{G}(\delta) \right\} \rightarrow 1,$$

we see that for all  $\varepsilon > 0$ ,

$$Pr_{\mu_m} \left\{ (\mu_{Y,m}, Z_{\tilde{\theta}}) \in \mathcal{H}(\varepsilon) \right\} \rightarrow 1$$

as well, which suffices to prove the desired claim for confidence sets. The same argument likewise implies the result for our median unbiased estimator.  $\square$

**Proof of Proposition 6** Provided  $\hat{\theta}$  is unique with probability one, we can write

$$Pr_\mu \left\{ \mu(\hat{\theta}) \in CS \right\} = \sum_{\tilde{\theta} \in \Theta, \tilde{\gamma} \in \Gamma} Pr_\mu \left\{ \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma} \right\} Pr_\mu \left\{ \mu(\tilde{\theta}) \in CS | \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma} \right\}.$$

Since  $\sum_{\tilde{\theta} \in \Theta, \tilde{\gamma} \in \Gamma} Pr_\mu \left\{ \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma} \right\} = 1$ , the result of the proposition follows immediately.  $\square$

**Proof of Lemma 2** Consider first the level-maximization case. Note that the assumption of the lemma implies that  $X(\tilde{\theta}) - X(\theta)$  has a non-degenerate normal distribution for all  $\mu$ . Since  $\Theta$  is finite, almost-sure uniqueness of  $\hat{\theta}$  follows immediately.

For norm-maximization, assume without loss of generality that  $Var \left( X(\theta) | X(\tilde{\theta}) \right) \neq 0$ . Note that  $\|X(\theta)\|$  is continuously distributed conditional on  $X(\tilde{\theta}) = x(\tilde{\theta})$  for all  $x(\tilde{\theta})$  and all

$\mu$ , so  $Pr_\mu \left\{ \|X(\hat{\theta})\| = \|X(\tilde{\theta})\| \right\} = 0$ . Almost-sure uniqueness of  $\hat{\theta}$  again follows immediately from finiteness of  $\Theta$ .  $\square$

**Proof of Proposition 7** The first part of the proposition follows immediately from Proposition 2. For the second part of the proposition, note that for  $CS^H$  either of the hybrid confidence sets,

$$\begin{aligned} Pr_\mu \left\{ \mu_Y(\hat{\theta}) \in CS^H \right\} &= Pr_\mu \left\{ \mu_Y(\hat{\theta}) \in CS_P^\beta \right\} \times \\ \sum_{\tilde{\theta} \in \Theta, \tilde{\gamma} \in \Gamma} Pr_\mu \left\{ \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma} \mid \mu_Y(\hat{\theta}) \in CS_P^\beta \right\} Pr_\mu \left\{ \mu_Y(\tilde{\theta}) \in CS^H \mid \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma}, \mu_Y(\tilde{\theta}) \in CS_P^\beta \right\} \\ &= Pr_\mu \left\{ \mu_Y(\hat{\theta}) \in CS_P^\beta \right\} \frac{1-\alpha}{1-\beta} \geq (1-\beta) \frac{1-\alpha}{1-\beta} = 1-\alpha, \end{aligned}$$

where the second equality follows from the first part of the proposition. The upper bound follows by the same argument and the fact that  $Pr_\mu \left\{ \mu_Y(\hat{\theta}) \in CS_P^\beta \right\} \leq 1$ .  $\square$

**Proof of Proposition 8** We first establish uniqueness of  $\hat{\mu}_\alpha^H$ . To do so, it suffices to show that  $F_{TN}^H(Y(\tilde{\theta}); \mu_Y(\tilde{\theta}), \tilde{\theta}, \tilde{\gamma}, Z_{\tilde{\theta}})$  is strictly decreasing in  $\mu_Y(\tilde{\theta})$ . Note first that this holds for the truncated normal assuming truncation that does not depend on  $\mu_Y(\tilde{\theta})$  by Lemma A.1 of Lee et al. (2016). When we instead consider  $F_{TN}^H(Y(\tilde{\theta}); \mu_Y(\tilde{\theta}), \tilde{\theta}, \tilde{\gamma}, Z_{\tilde{\theta}})$ , we impose truncation to

$$Y(\tilde{\theta}) \in \left[ \mu_Y(\tilde{\theta}) - c_\beta \sqrt{\Sigma_Y(\tilde{\theta})}, \mu_Y(\tilde{\theta}) + c_\beta \sqrt{\Sigma_Y(\tilde{\theta})} \right].$$

Since this interval shifts upwards as we increase  $\mu_Y(\tilde{\theta})$ ,  $F_{TN}^H(Y(\hat{\theta}); \mu_Y(\hat{\theta}), \tilde{\theta}, \tilde{\gamma}, Z_{\tilde{\theta}})$  is a fortiori decreasing in  $\mu_Y(\tilde{\theta})$ . Uniqueness of  $\hat{\mu}_\alpha^H$  for  $\alpha \in (0,1)$  follows. Note, next, that  $F_{TN}^H(Y(\tilde{\theta}); \mu_Y(\tilde{\theta}), \tilde{\theta}, \tilde{\gamma}, Z_{\tilde{\theta}}) \in \{0,1\}$  for  $\mu_Y(\tilde{\theta}) \notin CS_P^\beta$  from which we immediately see that  $\hat{\mu}_\alpha^H \in CS_P^\beta$ .

Finally, note that for  $\mu_Y(\tilde{\theta})$  the true value,

$$F_{TN}^H(Y(\hat{\theta}); \mu_Y(\tilde{\theta}), \tilde{\theta}, \tilde{\gamma}, Z_{\tilde{\theta}}) \sim U[0,1]$$

conditional on  $\left\{ \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma}, Z_{\hat{\theta}} = z_{\tilde{\theta}}, \mu_Y(\tilde{\theta}) \in CS_P^\beta \right\}$ . Since  $F_{TN}^H(Y(\hat{\theta}); \mu_Y(\tilde{\theta}), \tilde{\theta}, \tilde{\gamma}, Z_{\tilde{\theta}})$  is decreasing in  $\mu_Y(\tilde{\theta})$ ,

$$Pr_\mu \left\{ \hat{\mu}_\alpha^H \geq \mu_Y(\tilde{\theta}) \mid \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma}, Z_{\hat{\theta}} = z_{\tilde{\theta}}, \mu_Y(\tilde{\theta}) \in CS_P^\beta \right\}$$

$$= Pr_\mu \left\{ F_{TN}^H(Y(\hat{\theta}); \mu_Y(\tilde{\theta}), \tilde{\theta}, \tilde{\gamma}, Z_{\tilde{\theta}}) \geq 1 - \alpha \mid \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma}, Z_{\tilde{\theta}} = z_{\tilde{\theta}}, \mu_Y(\tilde{\theta}) \in CS_P^\beta \right\} = \alpha,$$

and thus  $\hat{\mu}_\alpha^H$  is  $\alpha$ -quantile-unbiased conditional on  $\left\{ \hat{\theta} = \tilde{\theta}, \hat{\gamma} = \tilde{\gamma}, Z_{\tilde{\theta}} = z_{\tilde{\theta}}, \mu_Y(\tilde{\theta}) \in CS_P^\beta \right\}$ . We can drop the conditioning on  $Z_{\tilde{\theta}}$  by the law of iterated expectations, and  $\alpha$ -quantile-unbiasedness conditional on  $\mu_Y(\tilde{\theta}) \in CS_P^\beta$  follows by the same argument as in the proof of Proposition 6.

**Proof of Lemma 3** Note that we can assume without loss of generality that  $\mu_{Y,0} = 0$  and  $\Sigma_Y(\tilde{\theta}) = 1$  since we can define  $Y^*(\tilde{\theta}) = (Y(\tilde{\theta}) - \mu_{Y,0}) / \sqrt{\Sigma_Y(\tilde{\theta})}$  and consider the problem of testing that the mean of  $Y^*(\tilde{\theta})$  is zero (transforming the set  $\mathcal{Y}_m$  accordingly). After deriving critical values  $(c_l^*, c_u^*)$  in this transformed problem, we can recover critical values for our original problem as  $(c_l, c_u) = \sqrt{\Sigma_Y(\tilde{\theta})}(c_l^*, c_u^*) + \mu_{Y,0}$ . Hence, for the remainder of the proof we assume that  $\mu_{Y,0} = 0$  and  $\Sigma_Y(\tilde{\theta}) = 1$ .

**Equal-Tailed Test** We consider first the equal-tailed test. Note that this test rejects if and only if

$$Y(\tilde{\theta}) \notin [c_{l,ET}(\mathcal{Y}), c_{u,ET}(\mathcal{Y})],$$

where we suppress the dependence of the critical values on  $\mu_{Y,0} = 0$  for simplicity, and  $(c_{l,ET}(\mathcal{Y}), c_{u,ET}(\mathcal{Y}))$  solve

$$\begin{aligned} F_{TN}(c_{l,ET}(\mathcal{Y}), \mathcal{Y}) &= \frac{\alpha}{2} \\ F_{TN}(c_{u,ET}(\mathcal{Y}), \mathcal{Y}) &= 1 - \frac{\alpha}{2}. \end{aligned}$$

for  $F_{TN}(\cdot, \mathcal{Y})$  the distribution function of a standard normal random variable truncated to  $\mathcal{Y}$ . Recall that we can write the density corresponding to  $F_{TN}(y, \mathcal{Y})$  as  $\frac{1\{y \in \mathcal{Y}\}}{Pr\{\xi \in \mathcal{Y}\}} f_N(y)$  where  $f_N$  is the standard normal density and  $Pr\{\xi \in \mathcal{Y}\}$  is the probability that  $\xi \in \mathcal{Y}$  for  $\xi \sim N(0,1)$ . Hence, we can write

$$F_{TN}(y, \mathcal{Y}) = \frac{\int_{-\infty}^y 1\{\tilde{y} \in \mathcal{Y}\} f_N(\tilde{y}) d\tilde{y}}{Pr\{\xi \in \mathcal{Y}\}}.$$

Note that that for all  $y$  we can write

$$F_{TN}(y, \mathcal{Y}_m) = a_m(y) + F_N(y),$$

where  $F_N$  is the standard normal distribution function and

$$a_m(y) = \frac{\int_{-\infty}^y 1\{\tilde{y} \in \mathcal{Y}_m\} f_N(\tilde{y}) d\tilde{y}}{Pr\{\xi \in \mathcal{Y}_m\}} - F_N(y).$$

Recall, however, that  $Pr\{\xi \in \mathcal{Y}_m\} \rightarrow 1$  and

$$\begin{aligned} \left| \int_{-\infty}^y 1\{\tilde{y} \in \mathcal{Y}_m\} f_N(\tilde{y}) d\tilde{y} - F_N(y) \right| &= \left| \int_{-\infty}^y [1\{\tilde{y} \in \mathcal{Y}_m\} - 1] f_N(\tilde{y}) d\tilde{y} \right| \\ &= \int_{-\infty}^y 1\{\tilde{y} \notin \mathcal{Y}_m\} f_N(\tilde{y}) d\tilde{y} \leq Pr\{\xi \notin \mathcal{Y}_m\} \rightarrow 0 \end{aligned}$$

for all  $y$ , so  $a_m(y) \rightarrow 0$  for all  $y$ . Theorem 2.11 in Van der Vaart (1998) then implies that  $a_m(y) \rightarrow 0$  uniformly in  $y$  as well.

Note next that

$$F_{TN}(c_{l,ET}(\mathcal{Y}_m), \mathcal{Y}_m) = a_m(c_{l,ET}(\mathcal{Y}_m)) + F_N(c_{l,ET}(\mathcal{Y}_m)) = \frac{\alpha}{2}$$

implies

$$c_{l,ET}(\mathcal{Y}_m) = F_N^{-1}\left(\frac{\alpha}{2} - a_m(c_{l,ET}(\mathcal{Y}_m))\right),$$

and thus that  $c_{l,ET}(\mathcal{Y}_m) \rightarrow F_N^{-1}\left(\frac{\alpha}{2}\right)$ . Using the same argument, we can show that  $c_{u,ET}(\mathcal{Y}_m) \rightarrow F_N^{-1}\left(1 - \frac{\alpha}{2}\right)$ , as desired.

**Unbiased Test** We next consider the unbiased test. Recall that critical values  $c_{l,U}(\mathcal{Y})$ ,  $c_{u,U}(\mathcal{Y})$  for the unbiased test solve

$$Pr\{\zeta \in [c_{l,U}(\mathcal{Y}), c_{u,U}(\mathcal{Y})]\} = 1 - \alpha$$

$$E[\zeta 1\{\zeta \in [c_{l,U}(\mathcal{Y}), c_{u,U}(\mathcal{Y})]\}] = (1 - \alpha)E[\zeta]$$

for  $\zeta \sim \xi | \xi \in \mathcal{Y}$  where  $\xi \sim N(0,1)$ .

Note that for  $\zeta_m$  the truncated normal random variable corresponding to  $\mathcal{Y}_m$ , we can write

$$Pr\{\zeta_m \in [c_l, c_u]\} = a_m(c_l, c_u) + (F_N(c_u) - F_N(c_l))$$

with

$$a_m(c_l, c_u) = (F_N(c_l) - Pr\{\zeta_m \leq c_l\}) - (F_N(c_u) - Pr\{\zeta_m \leq c_u\}).$$

As in the argument for equal-tailed tests above, we see that both  $F_N(c_u) - Pr\{\zeta_m \leq c_u\}$

and  $F_N(c_l) - Pr\{\zeta_m \leq c_l\}$  converge to zero pointwise, and thus uniformly in  $c_u$  and  $c_l$  by Theorem 2.11 in Van der Vaart (1998). Hence,  $a_m(c_l, c_u) \rightarrow 0$  uniformly in  $(c_l, c_u)$ .

Note, next, that we can write

$$E[\zeta_m 1\{\zeta_m \in [c_l, c_u]\}] = [E[\xi 1\{\xi \in [c_l, c_u]\}]] + b_m(c_l, c_u)$$

for

$$\begin{aligned} b_m(c_l, c_u) &= E[\zeta_m 1\{\zeta_m \in [c_l, c_u]\}] - [E[\xi 1\{\xi \in [c_l, c_u]\}]] \\ &= \int_{c_l}^{c_u} \left( \frac{1\{y \in \mathcal{Y}_m\}}{Pr\{\xi \in \mathcal{Y}_m\}} - 1 \right) y f_N(y) dy. \end{aligned}$$

Note, however, that

$$\int_{c_l}^{c_u} (1\{y \in \mathcal{Y}_m\} - 1) y f_N(y) dy \leq E[|\xi| 1\{\xi \notin \mathcal{Y}_m\}].$$

Hence, since

$$\begin{aligned} & \left| \int_{c_l}^{c_u} \left( \frac{1\{y \in \mathcal{Y}_m\}}{Pr\{\xi \in \mathcal{Y}_m\}} - 1\{y \in \mathcal{Y}_m\} \right) y f_N(y) dy \right| \\ & \leq \left| \left( \frac{1}{Pr\{\xi \in \mathcal{Y}_m\}} - 1 \right) \right| E[|\xi| 1\{\xi \notin \mathcal{Y}_m\}] \leq \left| \left( \frac{1}{Pr\{\xi \in \mathcal{Y}_m\}} - 1 \right) \right| \sqrt{P(\xi \notin \mathcal{Y}_m)} \end{aligned}$$

by the Cauchy-Schwartz Inequality, where the right hand side tends to zero and doesn't depend on  $(c_l, c_u)$ ,  $b_m(c_l, c_u)$  converges to zero uniformly in  $(c_l, c_u)$ .

Next, let us define  $(c_{l,m}, c_{u,m})$  as the solutions to

$$Pr\{\zeta_m \in [c_l, c_u]\} = 1 - \alpha$$

$$E[\zeta_m 1\{\zeta_m \in [c_l, c_u]\}] = (1 - \alpha) E[\zeta_m].$$

From our results above, we can re-write the problem solved by  $(c_{l,m}, c_{u,m})$  as

$$F_N(c_u) - F_N(c_l) = 1 - \alpha - a_m(c_l, c_u)$$

$$E[\xi 1\{\xi \in [c_l, c_u]\}] = (1 - \alpha) E[\zeta_m] - b_m(c_l, c_u).$$

Letting

$$\bar{a}_m = \sup_{c_l, c_u} |a_m(c_l, c_u)|,$$

$$\bar{b}_m = \sup_{c_l, c_u} |b_m(c_l, c_u)|$$

we thus see that  $(c_{l,m}, c_{u,m})$  solves

$$F_N(c_u) - F_N(c_l) = 1 - \alpha - a_m^*$$

$$E[\xi 1\{\xi \in [c_l, c_u]\}] = (1 - \alpha)E[\zeta_m] - b_m^*$$

for some  $a_m^* \in [-\bar{a}_m, \bar{a}_m]$ ,  $b_m^* \in [-\bar{b}_m, \bar{b}_m]$ . We will next show that for any sequence of values  $(a_m^*, b_m^*)$  such that  $a_m^* \in [-\bar{a}_m, \bar{a}_m]$  and  $b_m^* \in [-\bar{b}_m, \bar{b}_m]$  for all  $m$ , the implied solutions  $c_{l,m}(a_m^*, b_m^*)$ ,  $c_{u,m}(a_m^*, b_m^*)$  converge to  $F_N^{-1}(\frac{\alpha}{2})$  and  $F_N^{-1}(1 - \frac{\alpha}{2})$ . This follows from the next lemma, which is proved below.

**Lemma 4**

Suppose that  $c_{l,m}$  and  $c_{u,m}$  solve

$$Pr\{\xi \in [c_l, c_u]\} = 1 - \alpha + a_m,$$

$$E[\xi 1\{\xi \in [c_l, c_u]\}] = d_m$$

for  $a_m, d_m \rightarrow 0$ . Then  $(c_{l,m}, c_{u,m}) \rightarrow (-c_{\frac{\alpha}{2}, N}, c_{\frac{\alpha}{2}, N})$ .

Using this lemma, since  $E[\zeta_m] \rightarrow 0$  as  $m \rightarrow \infty$  we see that for any sequence of values  $(a_m^*, b_m^*) \rightarrow 0$ ,

$$(c_{l,m}(a_m^*, b_m^*), c_{u,m}(a_m^*, b_m^*)) \rightarrow (-c_{\frac{\alpha}{2}, N}, c_{\frac{\alpha}{2}, N}).$$

However, since  $\bar{a}_m, \bar{b}_m \rightarrow 0$  we know that the values  $a_m^*$  and  $b_m^*$  corresponding to the true  $c_{l,m}$ ,  $c_{u,m}$  must converge to zero. Hence  $(c_{l,m}, c_{u,m}) \rightarrow (-c_{\frac{\alpha}{2}, N}, c_{\frac{\alpha}{2}, N})$  as we wanted to show.  $\square$

**Proof of Lemma 4** Note that the critical values solve

$$f(a_m, d_m, c) = \begin{pmatrix} F_N(c_u) - F_N(c_l) - (1 - \alpha) - a_m \\ \int_{c_l}^{c_u} y f_N(y) dy - d_m \end{pmatrix} = 0.$$

We can simplify this expression, since  $\frac{\partial}{\partial y} f_N(y) = -y f_N(y)$ , so

$$\int_{c_l}^{c_u} y f_N(y) dy = f_N(c_l) - f_N(c_u).$$

We thus must solve the system of equations

$$F_N(c_u) - F_N(c_l) = (1 - \alpha) - a_m$$

$$f_N(c_l) - f_N(c_u) = d_m$$

or more compactly  $g(c) - v_m = 0$ , for

$$g(c) = \begin{pmatrix} F_N(c_u) - F_N(c_l) \\ f_N(c_l) - f_N(c_u) \end{pmatrix}, \quad v_m = \begin{pmatrix} a_m + (1 - \alpha) \\ d_m \end{pmatrix}.$$

Note that for  $v_m = (1 - \alpha, 0)'$  this system is solved by  $c = (-c_{\frac{\alpha}{2}, N}, c_{\frac{\alpha}{2}, N})$ . Further,

$$\frac{\partial}{\partial c} g(c) = \begin{pmatrix} -f_N(c_l) & f_N(c_u) \\ -c_l f_N(c_l) & c_u f_N(c_u) \end{pmatrix},$$

which evaluated at  $c = (-c_{\frac{\alpha}{2}, N}, c_{\frac{\alpha}{2}, N})$  is equal to

$$\begin{pmatrix} -f_N(c_{\frac{\alpha}{2}, N}) & f_N(c_{\frac{\alpha}{2}, N}) \\ c_{\frac{\alpha}{2}, N} f_N(c_{\frac{\alpha}{2}, N}) & c_{\frac{\alpha}{2}, N} f_N(c_{\frac{\alpha}{2}, N}) \end{pmatrix}$$

and has full rank for all  $\alpha \in (0, 1)$ . Thus, by the implicit function theorem there exists an open neighborhood  $V$  of  $v_\infty = (1 - \alpha, 0)$  such that  $g(c) - v = 0$  has a unique solution  $c(v)$  for  $v \in V$  and  $c(v)$  is continuously differentiable. Hence, if we consider any sequence of values  $v_m \rightarrow (1 - \alpha, 0)$ , we see that

$$c(v_m) \rightarrow \begin{pmatrix} -c_{\frac{\alpha}{2}, N} \\ c_{\frac{\alpha}{2}, N} \end{pmatrix},$$

again as we wanted to show.  $\square$

## B Additional Results

### B.1 Details for Empirical Welfare Maximization Example

Here, we derive the form of the conditioning event  $\mathcal{Y}_\gamma(1, Z_{\tilde{\theta}})$  discussed in Section 4.2, including for cases when  $\Sigma_{XY}(\tilde{\theta}) - \Sigma_{XY}(\tilde{\theta}, 0) \leq 0$ . Note that we can write

$$\left\{ X(\tilde{\theta}) - X(0) \geq c \right\} = \left\{ Z_{\tilde{\theta}}(\tilde{\theta}) - Z_{\tilde{\theta}}(0) + \frac{\Sigma_{XY}(\tilde{\theta}) - \Sigma_{XY}(\tilde{\theta}, 0)}{\Sigma_Y(\tilde{\theta})} Y(\tilde{\theta}) \geq c \right\}.$$

Rearranging, we see that

$$\mathcal{Y}_\gamma(1, Z_{\tilde{\theta}}) = \begin{cases} \left\{ y : y \geq \frac{\Sigma_Y(\tilde{\theta})(c - Z_{\tilde{\theta}}(\tilde{\theta}) + Z_{\tilde{\theta}}(0))}{\Sigma_{XY}(\tilde{\theta}) - \Sigma_{XY}(\tilde{\theta}, 0)} \right\} & \text{if } \Sigma_{XY}(\tilde{\theta}) - \Sigma_{XY}(\tilde{\theta}, 0) > 0 \\ \left\{ y : y \leq \frac{\Sigma_Y(\tilde{\theta})(c - Z_{\tilde{\theta}}(\tilde{\theta}) + Z_{\tilde{\theta}}(0))}{\Sigma_{XY}(\tilde{\theta}) - \Sigma_{XY}(\tilde{\theta}, 0)} \right\} & \text{if } \Sigma_{XY}(\tilde{\theta}) - \Sigma_{XY}(\tilde{\theta}, 0) < 0 \\ \mathbb{R} & \text{if } \Sigma_{XY}(\tilde{\theta}) - \Sigma_{XY}(\tilde{\theta}, 0) = 0 \\ & \text{and } Z_{\tilde{\theta}}(\tilde{\theta}) - Z_{\tilde{\theta}}(0) \geq c \\ \emptyset & \text{if } \Sigma_{XY}(\tilde{\theta}) - \Sigma_{XY}(\tilde{\theta}, 0) = 0 \\ & \text{and } Z_{\tilde{\theta}}(\tilde{\theta}) - Z_{\tilde{\theta}}(0) < c. \end{cases}$$

### B.2 Details for Threshold Regression Estimation Example

This section provides additional results to supplement our discussion of the threshold regression example in the text.

We begin by establishing the weak convergence (14). To do so, we show uniform convergence over any compact set  $\tilde{\Theta}$  in the interior of the support of  $Q_i$ , which implies uniform convergence over  $\Theta$ . Note, in particular, that under (12) and (13), the continuous mapping theorem implies that

$$\begin{aligned} & X_n(\theta) \Rightarrow X(\theta) \\ & = \left( \begin{array}{c} \Sigma_C(\theta)^{-1/2} \Sigma_{Cg}(\theta) \\ (\Sigma_C(\infty) - \Sigma_C(\theta))^{-1/2} (\Sigma_{Cg}(\infty) - \Sigma_{Cg}(\theta)) \end{array} \right) + \left( \begin{array}{c} \Sigma_C(\theta)^{-1/2} G(\theta) \\ (\Sigma_C(\infty) - \Sigma_C(\theta))^{-1/2} (G(\infty) - G(\theta)) \end{array} \right) \end{aligned}$$

uniformly on  $\tilde{\Theta}$ , where we use the following slight abuse of notation:

$$\frac{1}{n} \sum_{i=1}^n C_i C_i' \rightarrow_p \Sigma_C(\infty), \quad \frac{1}{n} \sum_{i=1}^n C_i C_i' g(Q_i) \rightarrow_p \Sigma_{Cg}(\infty), \quad \text{and} \quad \frac{1}{\sqrt{n}} \sum_{i=1}^n C_i U_i \Rightarrow G(\infty).$$

Hence, if we define  $\mu_X(\theta)$  to equal the first term, we obtain the convergence (14) for  $X_n$ .

Likewise, standard regression algebra (e.g. the FWL theorem) shows that

$$\sqrt{n}\hat{\delta}(\theta) \equiv \mathcal{A}_n(\theta)^{-1}[\mathcal{B}_n(\theta) + \mathcal{C}_n(\theta)],$$

for

$$\begin{aligned} \mathcal{A}_n(\theta) &\equiv n^{-1} \sum_{i=1}^n C_i C_i' 1(Q_i > \theta) - \left( n^{-1} \sum_{i=1}^n C_i C_i' 1(Q_i > \theta) \right) \left( n^{-1} \sum_{i=1}^n C_i C_i' \right)^{-1} \left( n^{-1} \sum_{i=1}^n C_i C_i' 1(Q_i > \theta) \right), \\ \mathcal{B}_n(\theta) &\equiv n^{-1} \sum_{i=1}^n C_i C_i' 1(Q_i > \theta) g(Q_i) - \left( n^{-1} \sum_{i=1}^n C_i C_i' 1(Q_i > \theta) \right) \left( n^{-1} \sum_{i=1}^n C_i C_i' \right)^{-1} \left( n^{-1} \sum_{i=1}^n C_i C_i' g(Q_i) \right), \\ \mathcal{C}_n(\theta) &\equiv n^{-1/2} \sum_{i=1}^n C_i U_i 1(Q_i > \theta) - \left( n^{-1} \sum_{i=1}^n C_i C_i' 1(Q_i > \theta) \right) \left( n^{-1} \sum_{i=1}^n C_i C_i' \right)^{-1} \left( n^{-1/2} \sum_{i=1}^n C_i U_i \right). \end{aligned}$$

Under (12) and (13), however, the continuous mapping theorem implies that

$$\begin{aligned} \mathcal{A}_n(\theta) &\rightarrow_p \Sigma_C(\infty) - \Sigma_C(\theta) - (\Sigma_C(\infty) - \Sigma_C(\theta)) \Sigma_C(\infty)^{-1} (\Sigma_C(\infty) - \Sigma_C(\theta)) \equiv \mathcal{A}(\theta), \\ \mathcal{B}_n(\theta) &\rightarrow_p \Sigma_{Cg}(\infty) - \Sigma_{Cg}(\theta) - (\Sigma_C(\infty) - \Sigma_C(\theta)) \Sigma_C(\infty)^{-1} \Sigma_{Cg}(\infty) \equiv \mathcal{B}(\theta), \\ \mathcal{C}_n(\theta) &\Rightarrow G(\infty) - G(\theta) - (\Sigma_C(\infty) - \Sigma_C(\theta)) \Sigma_C(\infty)^{-1} G(\infty) \equiv \mathcal{C}(\theta) \end{aligned}$$

all uniformly on  $\tilde{\Theta}$ , where this convergence holds jointly with that for  $X_n$ . By another application of the continuous mapping theorem,

$$Y_n(\theta) = e_j' \sqrt{n} \hat{\delta}(\theta) \Rightarrow Y(\theta) = e_j' \mathcal{A}(\theta)^{-1} [\mathcal{B}(\theta) + \mathcal{C}(\theta)].$$

Hence, if we define  $\mu_Y(\theta) = e_j' \mathcal{A}(\theta)^{-1} \mathcal{B}(\theta)$ , then  $\mu_{Y,n}(\theta) \rightarrow \mu_Y(\theta)$  uniformly in  $\theta \in \tilde{\Theta}$  and we obtain the convergence (14), as desired.

**Additional Conditioning Events** Arguments as in the proof of Proposition 4 show that if we define

$$\begin{aligned} \bar{A}(\tilde{\theta}) &\equiv \Sigma_Y(\tilde{\theta})^{-2} \sum_{i=1}^{d_X} \Sigma_{XY,i}(\tilde{\theta})^2, \\ \bar{B}_Z(\tilde{\theta}) &\equiv 2 \Sigma_Y(\tilde{\theta})^{-1} \sum_{i=1}^{d_X} \Sigma_{XY,i}(\tilde{\theta}) Z_{\tilde{\theta},i}(\tilde{\theta}), \end{aligned}$$

$$\bar{C}_Z(\tilde{\theta}) \equiv \sum_{i=1}^{d_X} Z_{\tilde{\theta},i}(\tilde{\theta})^2 - c, \quad \bar{D}_Z(\tilde{\theta}) \equiv \bar{B}_Z(\tilde{\theta})^2 - 4\bar{A}(\tilde{\theta})\bar{C}_Z(\tilde{\theta}),$$

$$\{\|X(\tilde{\theta})\|^2 \geq c\} = \left\{ Y(\tilde{\theta}) \leq \frac{-\bar{B}_Z(\tilde{\theta}) - \sqrt{D_Z(\tilde{\theta})}}{2\bar{A}(\tilde{\theta})} \text{ or } Y(\tilde{\theta}) \geq \frac{-\bar{B}_Z(\tilde{\theta}) + \sqrt{D_Z(\tilde{\theta})}}{2\bar{A}(\tilde{\theta})}, D_Z(\tilde{\theta}) \geq 0 \right\} \\ \cap \{\bar{C}_Z(\tilde{\theta}) \geq 0, D_Z(\tilde{\theta}) < 0\}$$

if  $\bar{A}(\tilde{\theta}) > 0$  and  $\{\|X(\tilde{\theta})\|^2 \geq c\} = \{\bar{C}_Z(\tilde{\theta}) \geq 0\}$  if  $\bar{A}(\tilde{\theta}) = 0$ , since  $\bar{A}(\tilde{\theta}) \geq 0$  by definition. Then for

$$\bar{\mathcal{L}}(Z_{\tilde{\theta}}) \equiv \frac{-\bar{B}_Z(\tilde{\theta}) - \sqrt{D_Z(\tilde{\theta})}}{2\bar{A}(\tilde{\theta})}, \\ \bar{\mathcal{U}}(Z_{\tilde{\theta}}) \equiv \frac{-\bar{B}_Z(\tilde{\theta}) + \sqrt{D_Z(\tilde{\theta})}}{2\bar{A}(\tilde{\theta})}, \\ \bar{\mathcal{V}}(Z_{\tilde{\theta}}) \equiv [1\{\bar{A}(\tilde{\theta}) = 0\} + 1\{\bar{A}(\tilde{\theta}) > 0, D_Z(\tilde{\theta}) < 0\}]\bar{C}_Z(\tilde{\theta}),$$

we see that if  $\bar{\mathcal{V}}(Z_{\tilde{\theta}}) \geq 0$  then  $\mathcal{Y}_\gamma(1, Z_{\tilde{\theta}}) = (\bar{\mathcal{L}}(Z_{\tilde{\theta}}), \bar{\mathcal{U}}(Z_{\tilde{\theta}}))^c$ , while  $\mathcal{Y}_\gamma(1, Z_{\tilde{\theta}}) = \emptyset$  otherwise.

## C Alternatives to Conventional Sample Splitting

In Section 4.3 of the main text, we discuss the relationship of our conditional approach to conventional sample splitting methods and note that the results of Fithian et al. (2017) imply that traditional sample splitting methods are dominated in our setting. Here, we derive optimal split-sample confidence sets and estimators as well as easy-to-implement confidence sets and estimators that dominate their conventional split-sample counterparts in the asymptotic version of the split-sample problem.

**The Split-Sample Limit Experiment** Let  $\tau$  denote the fraction of the full sample used to compute the estimated maximum and  $(X_n^1, Y_n^1)$  and  $(X_n^2, Y_n^2)$  denote rescaled data corresponding to the first and second portions of the data such that

$$(X_n^1, Y_n^1) = \tau^{-1/2}(X_{[\tau \cdot n]}, Y_{[\tau \cdot n]}),$$

$$(X_n^2, Y_n^2) = (1 - \tau)^{-1}((X_n, Y_n) - \sqrt{\tau}(X_{[\tau \cdot n] + 1}, Y_{[\tau \cdot n] + 1}))$$

with  $[a]$  denoting the nearest integer to  $a \in \mathbb{R}$ . Finally, let  $\hat{\theta}_n^1 = \operatorname{argmax}_{\theta \in \Theta} X_n^1(\theta)$  or  $\hat{\theta}_n^1 = \operatorname{argmax}_{\theta \in \Theta} \|X_n^1(\theta)\|$  denote the estimated maximum from the first part of the sample. In large samples,  $(X_n^1, Y_n^1)$ ,  $(X_n^2, Y_n^2)$  and  $\hat{\theta}_n^1$  behave according to

$$\begin{pmatrix} X^1 \\ Y^1 \end{pmatrix} \sim N(\mu, \Sigma),$$

$$\begin{pmatrix} X^2 \\ Y^2 \end{pmatrix} \sim N(\mu, c^{-1}\Sigma)$$

and

$$\hat{\theta}^1 = \operatorname{argmax}_{\theta \in \Theta} X^1(\theta)$$

or

$$\hat{\theta}^1 = \operatorname{argmax}_{\theta \in \Theta} \|X^1(\theta)\|,$$

where  $c = (1 - \tau)/\tau$  and  $(X^1, Y^1)$  is independent of  $(X^2, Y^2)$ . This is the generalization of the asymptotic problem discussed in Section 4.3 of the main text to arbitrary sample splits.<sup>29</sup>

Traditional sample splitting methods base inference on  $Y^2(\hat{\theta}^1)$ . Since  $Y^2$  is independent of  $X^1$ , and thus of  $\hat{\theta}^1$ , this ensures the (conditional) median-unbiasedness of conventional split-sample estimates  $Y^2(\hat{\theta}^1)$  and the (conditional) validity of conventional split-sample confidence sets

$$CS_{SS} = \left[ Y^2(\hat{\theta}^1) - \sqrt{c^{-1}\Sigma_Y(\hat{\theta}^1)}c_{\alpha/2, N}, Y^2(\hat{\theta}^1) + \sqrt{c^{-1}\Sigma_Y(\hat{\theta}^1)}c_{\alpha/2, N} \right]$$

but does not make full use of the information in the data. To derive optimal procedures in the sample splitting framework, we first derive a sufficient statistic for the unknown parameter  $\mu$  conditional on  $\{\hat{\theta}^1 = \tilde{\theta}\}$  and then apply classical exponential family results as in Section 4 of the main text.

**Optimal Estimators and Confidence Sets** The joint (unconditional) density of  $(X^1, Y^1, X^2, Y^2)$  is proportional to

$$\exp\left(-\frac{1}{2}\left(\begin{pmatrix} X^1 \\ Y^1 \end{pmatrix} - \mu\right)' \Sigma^{-1} \left(\begin{pmatrix} X^1 \\ Y^1 \end{pmatrix} - \mu\right)\right) \exp\left(-\frac{c}{2}\left(\begin{pmatrix} X^2 \\ Y^2 \end{pmatrix} - \mu\right)' \Sigma^{-1} \left(\begin{pmatrix} X^2 \\ Y^2 \end{pmatrix} - \mu\right)\right).$$

<sup>29</sup>For simplicity of exposition, in this section we suppress the possibility of using additional conditioning variables  $\hat{\gamma}_n = \gamma(X_n^1)$  with asymptotic counterpart  $\hat{\gamma} = \gamma(X^1)$ .

The conditional density given  $\{\hat{\theta}^1 = \tilde{\theta}\}$  is thus propotional to

$$\frac{1\{X^1 \in \mathcal{X}^1(\tilde{\theta})\}}{Pr_\mu\{X^1 \in \mathcal{X}^1(\tilde{\theta})\}} \exp\left(-\frac{1}{2}\left(\begin{pmatrix} X^1 \\ Y^1 \end{pmatrix} - \mu\right)' \Sigma^{-1} \left(\begin{pmatrix} X^1 \\ Y^1 \end{pmatrix} - \mu\right)\right) \times \\ \exp\left(-\frac{c}{2}\left(\begin{pmatrix} X^2 \\ Y^2 \end{pmatrix} - \mu\right)' \Sigma^{-1} \left(\begin{pmatrix} X^2 \\ Y^2 \end{pmatrix} - \mu\right)\right)$$

with  $\mathcal{X}^1(\tilde{\theta}) = \{X^1 : \hat{\theta} = \tilde{\theta}\}$ , which we can re-write as

$$g_1(X^1, Y^1) g_2(X^2, Y^2) h(\mu) \exp\left(\left(\begin{pmatrix} X^1 \\ Y^1 \end{pmatrix} + c \begin{pmatrix} X^2 \\ Y^2 \end{pmatrix}\right)' \Sigma^{-1} \mu\right)$$

for

$$g_1(X^1, Y^1) = 1\{X^1 \in \mathcal{X}^1(\tilde{\theta})\} \exp\left(-\frac{1}{2}\left(\begin{pmatrix} X^1 \\ Y^1 \end{pmatrix}\right)' \Sigma^{-1} \left(\begin{pmatrix} X^1 \\ Y^1 \end{pmatrix}\right)\right), \\ g_2(X^2, Y^2) = \exp\left(-\frac{c}{2}\left(\begin{pmatrix} X^2 \\ Y^2 \end{pmatrix}\right)' \Sigma^{-1} \left(\begin{pmatrix} X^2 \\ Y^2 \end{pmatrix}\right)\right),$$

and

$$h(\mu) = \frac{1}{Pr_\mu\{X^1 \in \mathcal{X}^1(\tilde{\theta})\}} \exp\left(-\frac{1+c}{2} \mu' \Sigma^{-1} \mu\right).$$

This exponential family structure shows that  $\begin{pmatrix} X^* \\ Y^* \end{pmatrix} = \left(\begin{pmatrix} X^1 \\ Y^1 \end{pmatrix} + c \begin{pmatrix} X^2 \\ Y^2 \end{pmatrix}\right)$  is sufficient for  $\mu$ . Hence, for any function of  $(X^1, Y^1, X^2, Y^2)$ , there exists a (potentially randomized) function of  $(X^*, Y^*)$  with the same distribution for all  $\mu$ . Thus, to study questions of optimality it is without loss to limit attention to confidence sets and estimators that depend only on  $(X^*, Y^*)$ .

Now that we have derived a sufficient statistic  $(X^*, Y^*)$  for  $\mu$ , we turn to the question of how to construct optimal estimators and confidence sets for  $\mu_Y(\tilde{\theta})$  conditional on  $\{\hat{\theta} = \tilde{\theta}\}$ .

Note that the unconditional density of  $(X^*, Y^*)$  is proportional to

$$\exp\left(-\frac{1}{2+2c}\left(\begin{pmatrix} X^* \\ Y^* \end{pmatrix}-(1+c)\mu\right)'\Sigma^{-1}\left(\begin{pmatrix} X^* \\ Y^* \end{pmatrix}-(1+c)\mu\right)\right).$$

The density of  $(X^*, Y^*)$  given  $\{\hat{\theta}^1 = \tilde{\theta}\}$  is thus proportional to

$$\frac{Pr\{X^1 \in \mathcal{X}^1(\tilde{\theta}) | X^*, Y^*\}}{Pr_\mu\{X^1 \in \mathcal{X}^1(\tilde{\theta})\}} \exp\left(-\frac{1}{2+2c}\left(\begin{pmatrix} X^* \\ Y^* \end{pmatrix}-(1+c)\mu\right)'\Sigma^{-1}\left(\begin{pmatrix} X^* \\ Y^* \end{pmatrix}-(1+c)\mu\right)\right),$$

where we have used sufficiency to drop dependence of the numerator on  $\mu$ .

This joint distribution has the same exponential family structure used to derive the optimal estimators and confidence sets in the main text (see the proofs of Propositions 1 and 2). Hence, the same arguments deliver optimal procedures for the split-sample setting. Specifically, for

$$Z_\theta^* = \begin{pmatrix} X^* \\ Y^* \end{pmatrix} - \left( Cov\left(\begin{pmatrix} X^* \\ Y^* \end{pmatrix}, Y^*(\tilde{\theta})\right) / \Sigma_{Y^*}(\tilde{\theta}) \right) Y^*(\tilde{\theta}),$$

where  $\Sigma_{Y^*}$  denotes the variance of  $Y^*$ , we can re-write

$$\exp\left(\left(\begin{pmatrix} X^1 \\ Y^1 \end{pmatrix} + c \begin{pmatrix} X^2 \\ Y^2 \end{pmatrix}\right) \Sigma^{-1} \mu\right) = \exp\left(Y^*(\tilde{\theta}) \mu_{Y^*}(\tilde{\theta}) / \Sigma_{Y^*}(\tilde{\theta}) + Z_\theta^* \Sigma_{Z^*}^+ \mu_{Z^*}\right)$$

for  $\Sigma_{Z^*}$  the variance of  $Z^*$ ,  $A^+$  the Moore-Penrose pseudoinverse of a matrix  $A$ , and

$$\mu_{Z^*} = (1+c)\mu - \left( Cov\left(\begin{pmatrix} X^* \\ Y^* \end{pmatrix}, Y^*(\tilde{\theta})\right) / Var(Y^*(\tilde{\theta})) \right) \mu_{Y^*}(\tilde{\theta}).$$

This expression shows that when we are interested in inference on  $\mu_{Y^*}(\tilde{\theta})$  conditional on  $\{\hat{\theta}^1 = \tilde{\theta}\}$ ,  $\mu_{Z^*}$  is the nuisance parameter, and  $Z_\theta^*$  is minimal sufficient for this parameter relative to observing  $(X^1, Y^1, X^2, Y^2)$ .

If we let  $F_{SS}^*(Y^*(\tilde{\theta}); \mu_{Y^*}(\tilde{\theta}), \tilde{\theta}, z^*)$  denote the conditional distribution function of  $Y^* | Z^* = z^*, \hat{\theta}^1 = \tilde{\theta}$ , then the same arguments used to prove Proposition 1 show that

the optimal  $\alpha$  quantile-unbiased estimator  $\hat{\mu}_{SS,\alpha}^*$  in the sample splitting problem solves

$$F_{SS}^*(Y^*(\hat{\theta}^1); (1+c)\hat{\mu}_{SS,\alpha}^*, \tilde{\theta}, Z_\theta^*) = 1 - \alpha.$$

Likewise, the same arguments used to prove Proposition 2 show that the optimal two-sided unbiased test rejects  $H_0: \mu_Y(\tilde{\theta}) = \mu_{Y,0}$  when

$$Y^*(\tilde{\theta}) \notin [c_l(Z_\theta^*), c_u(Z_\theta^*)],$$

where  $c_l(z)$ ,  $c_u(z)$  solve

$$Pr\{\zeta \in [c_l(z), c_u(z)]\} = 1 - \alpha, \quad E[\zeta 1\{\zeta \in [c_l(z), c_u(z)]\}] = (1 - \alpha)E[\zeta]$$

with  $\zeta$  distributed according to  $F_{SS}^*(\cdot; (1+c)\mu_{Y,0}, \tilde{\theta}, z)$ . These optimal procedures condition on  $Z_\theta^*$  rather than  $(X^1, Y^1)$  and so, unlike conventional sample splitting, continue to treat  $(X^1, Y^1)$  as random for inference.

**Feasible Dominating Estimators and Confidence Sets** To implement the optimal split-sample procedures, we need to evaluate (or at least be able to draw from) the conditional distribution  $F_{SS}^*(\cdot; (1+c)\mu_{Y,0}, \tilde{\theta}, z)$ . Unfortunately, however, it is not computationally straightforward to do so since  $Y^*|Z^* = z^*, \hat{\theta}^1 = \tilde{\theta}$  is distributed as a normal random variable truncated to a dependent random set. We thus introduce side constraints to derive procedures that, although they are not fully optimal in the unconstrained problem, are computationally straightforward to implement and dominate conventional sample splitting procedures. These computationally feasible procedures are optimal within the class of split-sample procedures that condition on  $\{\hat{\theta}^1 = \tilde{\theta}\}$  and the realizations of

$$Z_\theta^i = X^i - \left( \Sigma_{XY}(\cdot, \tilde{\theta}) / \Sigma_Y(\tilde{\theta}) \right) Y^i(\tilde{\theta})$$

for  $i = 1, 2$ , where  $(Z_\theta^1, Z_\theta^2)$  is a sufficient statistic for the nuisance parameter  $\mu_X$ . Since  $Y^2(\hat{\theta}^1) | \{\hat{\theta}^1 = \tilde{\theta}, (Z_\theta^1, Z_\theta^2) = (z^1, z^2)\} \sim Y^2(\tilde{\theta})$ , the conventional split-sample estimator  $Y^2(\hat{\theta}^1)$  and confidence set  $CS_{SS}$  fall within the class of split-sample conditional procedures that condition on  $\{\hat{\theta}^1 = \tilde{\theta}\}$  and  $(Z_\theta^1, Z_\theta^2)$ . These conventional procedures are therefore dominated by the optimal procedures within this class, which we now describe.

Standard exponential family arguments show that  $(Z_\theta^1, Z_\theta^2)$  is sufficient for the nuisance parameter  $\mu_X$  and, conditional on  $\{\hat{\theta}^1 = \tilde{\theta}\}$  and  $(Z_\theta^1, Z_\theta^2)$ , optimal estimation and inference

is based upon the conditional distribution of  $Y^*(\tilde{\theta})$ . Note that since  $Y^2(\tilde{\theta})$  is independent of  $(Z_{\tilde{\theta}}^1, Z_{\tilde{\theta}}^2)$  and both  $\hat{\theta}^1$  and  $Y^2(\tilde{\theta})$  are independent of  $Z_{\tilde{\theta}}^2$ ,

$$Y^*(\tilde{\theta})|\{\hat{\theta}^1 = \tilde{\theta}, (Z_{\tilde{\theta}}^1, Z_{\tilde{\theta}}^2) = (z^1, z^2)\} \sim Y^1(\tilde{\theta})|\{\hat{\theta}^1 = \tilde{\theta}, Z_{\tilde{\theta}}^1 = z^1\} + cY^2(\tilde{\theta}).$$

Thus, the feasible dominating split-sample procedures rely upon the computation of the distribution function of  $Y^1(\tilde{\theta})|\{\hat{\theta}^1 = \tilde{\theta}, Z_{\tilde{\theta}}^1 = z^1\} + cY^2(\tilde{\theta})$ . We now describe a fast computational method for computing this object.

In analogy with full sample inference, let

$$\mathcal{Y}^1(\tilde{\theta}, z^1) = \left\{ y^1 : z^1 + \left( \Sigma_{XY}(\cdot, \tilde{\theta}) / \Sigma_Y(\tilde{\theta}) \right) y^1 \right\}$$

so that conditional on  $\{\hat{\theta}^1 = \tilde{\theta}\}$  and  $Z_{\tilde{\theta}}^1 = z^1$ ,  $Y^1(\tilde{\theta})$  follows a one-dimensional truncated normal distribution with truncation set  $\mathcal{Y}^1(\tilde{\theta}, z^1)$ . Note that in both the level and norm maximization contexts,  $\mathcal{Y}^1(\tilde{\theta}, z^1)$  can be expressed as a finite union of disjoint intervals:  $\mathcal{Y}^1(\tilde{\theta}, z^1) = \bigcup_{k=1}^K [\ell_k(z^1), u_k(z^1)]$ , where the dependence of  $\ell_k(z^1)$  and  $u_k(z^1)$  for  $k=1, \dots, K$  on  $\tilde{\theta}$  is suppressed for notational simplicity. Note that  $Y^1(\tilde{\theta})|\{\hat{\theta}^1 = \tilde{\theta}, Z_{\tilde{\theta}}^1 = z^1\}$  is distributed as  $\xi^1 | \xi^1 \in \mathcal{Y}^1(\tilde{\theta}, z^1)$ , where  $\xi^1 \sim N(\mu_Y(\tilde{\theta}), \Sigma_Y(\tilde{\theta}))$ . The density function of  $Y^1(\tilde{\theta})|\{\hat{\theta}^1 = \tilde{\theta}, Z_{\tilde{\theta}}^1 = z^1\}$  is thus

$$f^1(y^1) = \frac{\sum_{k=1}^K f_N \left( (y^1 - \mu_Y(\tilde{\theta})) / \sqrt{\Sigma_Y(\tilde{\theta})} \right) 1(\ell_k(z^1) \leq y^1 \leq u_k(z^1))}{\sqrt{\Sigma_Y(\tilde{\theta})} \sum_{k=1}^K \left( F_N \left( (u_k(z^1) - \mu_Y(\tilde{\theta})) / \sqrt{\Sigma_Y(\tilde{\theta})} \right) - F_N \left( (\ell_k(z^1) - \mu_Y(\tilde{\theta})) / \sqrt{\Sigma_Y(\tilde{\theta})} \right) \right)}$$

and  $cY^2(\tilde{\theta})$  has density function  $f^2(y^2) = c^{-1/2} \Sigma_Y(\tilde{\theta})^{-1/2} f_N \left( (y^2 - c\mu) / \sqrt{c\Sigma_Y(\tilde{\theta})} \right)$ . Therefore, since  $Y^1(\tilde{\theta})|\{\hat{\theta}^1 = \tilde{\theta}, Z_{\tilde{\theta}}^1 = z^1\}$  and  $cY^2(\tilde{\theta})$  are independent, the density function of  $Y^*(\tilde{\theta})|\{\hat{\theta}^1 = \tilde{\theta}, Z_{\tilde{\theta}}^1 = z^1\}$  is equal to

$$\frac{\sum_{k=1}^K \int_{\ell_k(z^1)}^{u_k(z^1)} f_N \left( (t - \mu_Y(\tilde{\theta})) / \sqrt{\Sigma_Y(\tilde{\theta})} \right) f_N \left( (y^* - t - c\mu_Y(\tilde{\theta})) / \sqrt{c\Sigma_Y(\tilde{\theta})} \right) dt}{\sqrt{c\Sigma_Y(\tilde{\theta})} \sum_{k=1}^K \left( F_N \left( (u_k(z^1) - \mu_Y(\tilde{\theta})) / \sqrt{\Sigma_Y(\tilde{\theta})} \right) - F_N \left( (\ell_k(z^1) - \mu_Y(\tilde{\theta})) / \sqrt{\Sigma_Y(\tilde{\theta})} \right) \right)}$$

with corresponding distribution function

$$\begin{aligned}
& F_{SS}^A(y^*; \mu_Y(\tilde{\theta}), \tilde{\theta}, z^1) \\
&= \frac{\sum_{k=1}^K \int_{\ell_k(z^1)}^{u_k(z^1)} f_N\left(\frac{t - \mu_Y(\tilde{\theta})}{\sqrt{\Sigma_Y(\tilde{\theta})}}\right) F_N\left(\frac{y^* - t - c\mu_Y(\tilde{\theta})}{\sqrt{c\Sigma_Y(\tilde{\theta})}}\right) dt}{\sqrt{\Sigma_Y(\tilde{\theta})} \sum_{k=1}^K \left( F_N\left(\frac{u_k(z^1) - \mu_Y(\tilde{\theta})}{\sqrt{\Sigma_Y(\tilde{\theta})}}\right) - F_N\left(\frac{\ell_k(z^1) - \mu_Y(\tilde{\theta})}{\sqrt{\Sigma_Y(\tilde{\theta})}}\right) \right)} \\
&= \frac{E\left[ F_N\left(\frac{y^* - \xi^1 - c\mu_Y(\tilde{\theta})}{\sqrt{c\Sigma_Y(\tilde{\theta})}}\right) \mathbf{1}\left(\xi^1 \in \bigcup_{k=1}^K [\ell_k(z^1), u_k(z^1)]\right) \right]}{\sum_{k=1}^K \left( F_N\left(\frac{u_k(z^1) - \mu_Y(\tilde{\theta})}{\sqrt{\Sigma_Y(\tilde{\theta})}}\right) - F_N\left(\frac{\ell_k(z^1) - \mu_Y(\tilde{\theta})}{\sqrt{\Sigma_Y(\tilde{\theta})}}\right) \right)},
\end{aligned}$$

where the expectation is taken with respect to  $\xi^1 \sim N(\mu_Y(\tilde{\theta}), \Sigma_Y(\tilde{\theta}))$ . This latter expression for  $F_{SS}^A(y^*; \mu_Y(\tilde{\theta}), \tilde{\theta}, z^1)$  is very easy to compute by generating normal random variables in standard software packages. This makes the computation of optimal estimators, tests and confidence intervals within the class discussed here computationally straightforward.

Similarly to the optimal case above, the same arguments used to prove Proposition 1 show that the optimal  $\alpha$  quantile-unbiased estimator  $\hat{\mu}_{SS,\alpha}^A$  in the sample splitting problem that conditions on  $\{\hat{\theta}^1 = \tilde{\theta}\}$  and the realizations of  $Z_{\tilde{\theta}}^1$  and  $Z_{\tilde{\theta}}^2$  solves

$$F_{SS}^A(Y^*(\hat{\theta}^1); \hat{\mu}_{SS,\alpha}^A, \tilde{\theta}, Z_{\tilde{\theta}}^1) = 1 - \alpha.$$

Therefore, our (equal-tailed) alternative split-sample confidence set is  $C_{SS}^A = [\hat{\mu}_{SS,\alpha/2}^A; \hat{\mu}_{SS,1-\alpha/2}^A]$ . Likewise, the same arguments used to prove Proposition 2 show that the optimal two-sided unbiased test rejects  $H_0: \mu_Y(\tilde{\theta}) = \mu_{Y,0}$  when

$$Y^*(\tilde{\theta}) \notin [c_l(Z_{\tilde{\theta}}^1), c_u(Z_{\tilde{\theta}}^1)],$$

where  $c_l(z)$ ,  $c_u(z)$  solve

$$Pr\{\zeta \in [c_l(z), c_u(z)]\} = 1 - \alpha, \quad E[\zeta \mathbf{1}\{\zeta \in [c_l(z), c_u(z)]\}] = (1 - \alpha)E[\zeta]$$

with  $\zeta$  distributed according to  $F_{SS}^A(\cdot; \mu_{Y,0}, \tilde{\theta}, z)$ . These dominating procedures condition on  $Z_{\tilde{\theta}}^1$  rather than  $(X^1, Y^1)$ , and so unlike conventional sample splitting continue to treat  $(X^1, Y^1)$  as random for inference.

## D Uniformity Results

In this section, we show that the results derived in the main text for the finite-sample normal model translate to uniform asymptotic results over large classes of data generating processes. To state and prove these results, it will be important to distinguish between finite-sample and asymptotic objects. To keep this distinction clear, we will subscript finite-sample objects by the sample size, writing  $X_n, Y_n, \widehat{\Sigma}_n$ , and so on. Moreover, the estimators and confidence sets  $\hat{\mu}_{\alpha,n}, \hat{\mu}_{\alpha,n}^H, CS_{ET,n}, CS_{ET,n}^H, CS_{U,n}, CS_{U,n}^H$  and  $CS_{P,n}$  are equal to their asymptotic counterparts  $\hat{\mu}_\alpha, \hat{\mu}_\alpha^H, CS_{ET}, CS_{ET}^H, CS_U, CS_U^H$  and  $CS_P$  after replacing  $X, Y, \Sigma$  with  $X_n, Y_n, \widehat{\Sigma}_n$ .

With this notation, we aim to prove, for example, that for  $\hat{\mu}_{\alpha,n}$  our  $\alpha$ -quantile unbiased estimator calculated using  $(X_n, Y_n, \widehat{\Sigma}_n)$ ,  $\mu_{Y,n}(\theta; P)$  the analog of  $\mu_Y(\theta)$  in the sample of size  $n$ , and data generating process  $P$ ,

$$\lim_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \hat{\mu}_{\alpha,n} \geq \mu_{Y,n}(\hat{\theta}_n; P) \right\} - \alpha \right| = 0,$$

so  $\hat{\mu}_{\alpha,n}$  is (unconditionally) asymptotically  $\alpha$ -quantile unbiased uniformly over the (possibly sample-size dependent) class of data generating processes  $\mathcal{P}_n$ . Moreover, we will show that for all  $\tilde{\theta} \in \Theta$

$$\lim_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \hat{\mu}_{\alpha,n} \geq \mu_{Y,n}(\hat{\theta}_n; P) \mid \hat{\theta}_n = \tilde{\theta} \right\} - \alpha \mid Pr_P \left\{ \hat{\theta}_n = \tilde{\theta} \right\} \right| = 0,$$

so asymptotic quantile unbiasedness also holds conditional on the event  $\{\hat{\theta}_n = \tilde{\theta}\}$  provided this event occurs with non-trivial asymptotic probability. One could use arguments along the same lines as those below to derive results for additional conditioning variables  $\hat{\gamma}_n$ , but since such arguments would be case-specific, and we do not pursue such an extension here.

Asymptotic uniformity results for conditional inference procedures that, like our corrections, rely on truncated normal distributions were previously established by Tibshirani et al. (2018). Their results cover a class of models that nests our level maximization problem but not our norm maximization problem, and impose an assumption that implies bounded asymptotic means (analogous to our Assumption 5 below). Since we do not impose this assumption in our analysis of level-maximization, neither our norm nor level maximization results are nested by theirs. Moreover, these authors do not cover hybrid inference procedures, which are new to the literature, and also do not provide results for quantile-unbiased estimation. Our proofs are based on subsequencing arguments as in An-

draws et al. (2018), though due to the differences in our setting (our interest in conditional inference, and the fact that our target is random from an unconditional perspective) we cannot directly apply their results. In the subsequent analysis,  $F_N$  and  $f_N$  denote the cdf and pdf of the standard normal distribution.

## D.1 Asymptotic Validity for Level Maximization

Section D.1.1 collects the assumptions we use to prove uniform asymptotic validity. Section D.1.2 then states our uniformity results. Section D.1.3 collects a series of technical lemmas which we use to prove our uniformity results. Finally, Sections D.1.4 and D.1.5 collect proofs for the lemmas and the uniformity results, respectively.

### D.1.1 Assumptions

To derive our asymptotic uniformity results, we use the fact that all our estimates and confidence sets are functions of  $(X_n, Y_n, \widehat{\Sigma}_n)$ . Hence, to derive our results it suffices to state assumptions in terms of the behavior of these objects.

#### Assumption 2

*Our estimator  $\widehat{\Sigma}_n$  is uniformly consistent for some function  $\Sigma(P)$ ,*

$$\lim_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \left\{ \left\| \widehat{\Sigma}_n - \Sigma(P) \right\| > \varepsilon \right\} = 0$$

*for all  $\varepsilon > 0$ .*

This assumption requires that our variance estimator  $\widehat{\Sigma}_n$  be consistent for some  $\Sigma(P)$ , which our later assumptions will take to be the asymptotic variance matrix of  $(X'_n, Y'_n)'$  under  $P$ , uniformly over  $\mathcal{P}_n$ .

#### Assumption 3

*There exists a finite  $\bar{\lambda} > 0$  such that for  $\lambda_{\min}(A)$  and  $\lambda_{\max}(A)$  the minimum and maximum eigenvalues of a matrix  $A$ ,*

$$1/\bar{\lambda} \leq \lambda_{\min}(\Sigma_X(P)) \leq \lambda_{\max}(\Sigma_X(P)) \leq \bar{\lambda} \text{ for all } P \in \mathcal{P}_n$$

*and*

$$1/\bar{\lambda} \leq \Sigma_Y(\theta; P) \leq \bar{\lambda} \text{ for all } \theta \in \Theta \text{ and all } P \in \mathcal{P}_n.$$

This assumption bounds the variance matrix  $\Sigma_X(P)$  above and away from singularity, and likewise bounds the diagonal elements of  $\Sigma_Y(P)$  above and away from zero. This

ensures that the set of covariance matrices consistent with  $P \in \mathcal{P}_n$  is a subset of a compact set, and that  $X_n(\theta)$  has a unique maximum with probability tending to one.

**Assumption 4**

For  $BL_1$  the class of Lipschitz functions that are bounded in absolute value by one and have Lipschitz constant bounded by one, and  $\xi_P \sim N(0, \Sigma(P))$ ,

$$\lim_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \sup_{f \in BL_1} \left| E_P \left[ f \begin{pmatrix} X_n - \mu_{X,n}(P) \\ Y_n - \mu_{Y,n}(P) \end{pmatrix} \right] - E[f(\xi_P)] \right| = 0$$

for some sequence of functions  $\mu_{X,n}(P)$  and  $\mu_{Y,n}(P)$ .

Bounded Lipschitz distance metrizes convergence in distribution, so uniform convergence in bounded Lipschitz, as we assume here, is one formalization for uniform convergence in distribution. Hence, this assumption requires that

$$(X'_n - \mu_{X,n}(P)', Y'_n - \mu_{Y,n}(P)')$$

be asymptotically  $N(0, \Sigma(P))$  distributed, uniformly over  $P \in \mathcal{P}_n$ .

**D.1.2 Level Maximization Uniformity Results**

For  $\hat{\theta}_n = \operatorname{argmax}_{\theta} X_n(\theta)$  we obtain the following results.

**Proposition 9**

Under Assumptions 2-4, for  $\hat{\theta}_n = \operatorname{argmax}_{\theta} X_n(\theta)$  and  $\hat{\mu}_{\alpha,n}$  the  $\alpha$ -quantile unbiased estimator,

$$\lim_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \hat{\mu}_{\alpha,n} \geq \mu_{Y,n}(\hat{\theta}_n; P) \mid \hat{\theta}_n = \tilde{\theta} \right\} - \alpha \right| Pr_P \left\{ \hat{\theta}_n = \tilde{\theta} \right\} = 0, \quad (31)$$

for all  $\tilde{\theta} \in \Theta$ , and

$$\lim_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \hat{\mu}_{\alpha,n} \geq \mu_{Y,n}(\hat{\theta}_n; P) \right\} - \alpha \right| = 0. \quad (32)$$

**Corollary 1**

Under Assumptions 2-4, for  $\hat{\theta}_n = \operatorname{argmax}_{\theta} X_n(\theta)$  and  $CS_{ET,n}$  the level  $1 - \alpha$  equal-tailed confidence set,

$$\lim_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n} \mid \hat{\theta}_n = \tilde{\theta} \right\} - (1 - \alpha) \right| Pr_P \left\{ \hat{\theta}_n = \tilde{\theta} \right\} = 0,$$

for all  $\tilde{\theta} \in \Theta$ , and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n} \right\} - (1-\alpha) \right| = 0.$$

**Proposition 10**

Under Assumptions 2-4, for  $\hat{\theta}_n = \arg \max_{\theta} X_n(\theta)$  and  $CS_{U,n}$  the level  $1 - \alpha$  unbiased confidence set,

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n} | \hat{\theta}_n = \tilde{\theta} \right\} - (1-\alpha) \right| Pr_P \left\{ \hat{\theta}_n = \tilde{\theta} \right\} = 0, \quad (33)$$

for all  $\tilde{\theta} \in \Theta$ , and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n} \right\} - (1-\alpha) \right| = 0. \quad (34)$$

**Proposition 11**

Under Assumptions 2-4, for  $\hat{\theta}_n = \arg \max_{\theta} X_n(\theta)$  and  $CS_{P,n}$  the level  $1 - \alpha$  projection confidence set,

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{P,n} \right\} \geq 1 - \alpha. \quad (35)$$

**Proposition 12**

Under Assumptions 2-4, for  $\hat{\theta}_n = \arg \max_{\theta} X_n(\theta)$ ,  $\hat{\mu}_{\alpha,n}^H$  the  $\alpha$ -quantile unbiased hybrid estimator based on initial confidence set  $CS_{P,n}^\beta$ , and

$$C_n^H(\tilde{\theta}; P) = 1 \left\{ \hat{\theta}_n = \tilde{\theta}, \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{P,n}^\beta \right\},$$

we have

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \hat{\mu}_{\alpha,n}^H \geq \mu_{Y,n}(\hat{\theta}_n; P) | C_n^H(\tilde{\theta}; P) = 1 \right\} - \alpha \right| E_P \left\{ C_n^H(\tilde{\theta}; P) \right\} = 0, \quad (36)$$

for all  $\tilde{\theta} \in \Theta$ . Moreover

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \hat{\mu}_{\alpha,n}^H \geq \mu_{Y,n}(\hat{\theta}_n; P) \right\} - \alpha \right| \leq \max\{\alpha, 1 - \alpha\} \beta. \quad (37)$$

**Corollary 2**

Under Assumptions 2-4, for  $\hat{\theta}_n = \arg \max_{\theta} X_n(\theta)$  and  $CS_{ET,n}^H$  the level  $1 - \alpha$  equal-tailed

hybrid confidence set based on initial confidence set  $CS_{P,n}^\beta$ ,

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n}^H | C_n^H(\tilde{\theta}; P) = 1 \right\} - \frac{1-\alpha}{1-\beta} \right| E_P \left\{ C_n^H(\tilde{\theta}; P) \right\} = 0, \quad (38)$$

for all  $\tilde{\theta} \in \Theta$ ,

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n}^H \right\} \geq 1-\alpha, \quad (39)$$

and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n}^H \right\} \leq \frac{1-\alpha}{1-\beta} \leq 1-\alpha+\beta. \quad (40)$$

### Proposition 13

Under Assumptions 2-4, for  $\hat{\theta}_n = \operatorname{argmax}_\theta X_n(\theta)$  and  $CS_{U,n}^H$  the level  $1-\alpha$  unbiased hybrid confidence set based on initial confidence set  $CS_{P,n}^\beta$ ,

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n}^H | C_n^H(\tilde{\theta}; P) = 1 \right\} - \frac{1-\alpha}{1-\beta} \right| E_P \left\{ C_n^H(\tilde{\theta}; P) \right\} = 0,$$

for all  $\tilde{\theta} \in \Theta$ ,

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n}^H \right\} \geq 1-\alpha,$$

and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n}^H \right\} \leq \frac{1-\alpha}{1-\beta} \leq 1-\alpha+\beta.$$

### D.1.3 Auxiliary Lemmas

This section collects lemmas that we will use to prove our uniformity results.

#### Lemma 5

Under Assumption 3, for any sequence of confidence sets  $CS_n$ , any sequence of sets  $\mathcal{C}_n(P)$  indexed by  $P$ ,  $C_n(P) = 1 \left\{ \left( X_n, Y_n, \hat{\Sigma}_n \right) \in \mathcal{C}_n(P) \right\}$ , and any constant  $\alpha$ , to show that

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n | C_n(P) = 1 \right\} - \alpha \right| Pr_P \left\{ C_n(P) = 1 \right\} = 0$$

it suffices to show that for all subsequences  $\{n_s\} \subseteq \{n\}$ ,  $\{P_{n_s}\} \in \mathcal{P}^\infty = \times_{n=1}^\infty \mathcal{P}_n$  with:

1.  $\Sigma(P_{n_s}) \rightarrow \Sigma^* \in \mathcal{S}$  for

$$\mathcal{S} = \left\{ \Sigma : 1/\bar{\lambda} \leq \lambda_{\min}(\Sigma_X) \leq \lambda_{\max}(\Sigma_X) \leq \bar{\lambda}, 1/\bar{\lambda} \leq \Sigma_Y(\theta) \leq \bar{\lambda} \right\}, \quad (41)$$

2.  $Pr_{P_{n_s}}\{C_{n_s}(P_{n_s})=1\} \rightarrow p^* \in (0,1]$ , and  
3.  $\mu_{X,n_s}(P_{n_s}) - \max_{\theta} \mu_{X,n_s}(\theta; P_{n_s}) \rightarrow \mu_X^* \in \mathcal{M}_X^*$  for

$$\mathcal{M}_X^* = \left\{ \mu_X \in [-\infty, 0]^{|\Theta|} : \max_{\theta} \mu_X(\theta) = 0 \right\},$$

we have

$$\lim_{s \rightarrow \infty} Pr_{P_{n_s}} \left\{ \mu_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{n_s} \mid C_{n_s}(P_{n_s}) = 1 \right\} = \alpha. \quad (42)$$

**Lemma 6**

For a collection of sequences of sets  $\mathcal{C}_{n,1}(P), \dots, \mathcal{C}_{n,j}(P)$  and

$$C_{n,j}(P) = 1 \left\{ (X_n, Y_n, \hat{\Sigma}_n) \in \mathcal{C}_{n,j}(P) \right\},$$

if

$$\lim_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \{ C_{n,j}(P) = 1, C_{n,j'}(P) = 1 \} = 0 \text{ for all } j \neq j'$$

and

$$\lim_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n \mid C_{n,j}(P) = 1 \right\} - (1-\alpha) \right| Pr_P \{ C_{n,j}(P) = 1 \} = 0$$

for all  $j$ , then

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n \right\} \geq (1-\alpha) \cdot \liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} \sum_j Pr_P \{ C_{n,j}(P) = 1 \}$$

and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n \right\} \leq 1 - \alpha \liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} \sum_j Pr_P \{ C_{n,j}(P) = 1 \}.$$

To state the next lemma, define

$$\mathcal{L}(\tilde{\theta}, Z, \Sigma) = \max_{\theta \in \Theta : \Sigma_{XY}(\tilde{\theta}) > \Sigma_{XY}(\tilde{\theta}, \theta)} \frac{\Sigma_Y(\tilde{\theta})(Z(\theta) - Z(\tilde{\theta}))}{\Sigma_{XY}(\tilde{\theta}) - \Sigma_{XY}(\tilde{\theta}, \theta)} \quad (43)$$

$$\mathcal{U}(\tilde{\theta}, Z, \Sigma) = \min_{\theta \in \Theta: \Sigma_{XY}(\tilde{\theta}) < \Sigma_{XY}(\tilde{\theta}, \theta)} \frac{\Sigma_Y(\tilde{\theta})(Z(\theta) - Z(\tilde{\theta}))}{\Sigma_{XY}(\tilde{\theta}) - \Sigma_{XY}(\tilde{\theta}, \theta)}, \quad (44)$$

where we define a maximum over the empty set as  $-\infty$  and a minimum over the empty set as  $+\infty$ . For

$$\begin{pmatrix} X_n^* \\ Y_n^* \end{pmatrix} = \begin{pmatrix} X_n - \max_{\theta} \mu_{X,n}(\theta; P) \\ Y_n - \mu_{Y,n}(P) \end{pmatrix},$$

we next show that using  $(X_n^*, Y_n^*, \widehat{\Sigma}_n)$  in our calculations yields the same bounds  $\mathcal{L}$  and  $\mathcal{U}$  as using  $(X_n, Y_n, \widehat{\Sigma}_n)$ , up to additive shifts

**Lemma 7**

For  $\mathcal{L}(\tilde{\theta}, Z, \Sigma)$  and  $\mathcal{U}(\tilde{\theta}, Z, \Sigma)$  as defined in (43) and (44), and

$$Z_{\tilde{\theta},n} = X_n(\theta) - \frac{\widehat{\Sigma}_{XY,n}(\theta, \tilde{\theta})}{\widehat{\Sigma}_{Y,n}(\tilde{\theta})} Y_n(\tilde{\theta}), \quad Z_{\tilde{\theta},n}^* = X_n^*(\theta) - \frac{\widehat{\Sigma}_{XY,n}(\theta, \tilde{\theta})}{\widehat{\Sigma}_{Y,n}(\tilde{\theta})} Y_n^*(\tilde{\theta}),$$

we have

$$\begin{aligned} \mathcal{L}(\tilde{\theta}, Z_{\tilde{\theta},n}^*, \widehat{\Sigma}_n) &= \mathcal{L}(\tilde{\theta}, Z_{\tilde{\theta},n}, \widehat{\Sigma}_n) - \mu_{Y,n}(\tilde{\theta}; P) \\ \mathcal{U}(\tilde{\theta}, Z_{\tilde{\theta},n}^*, \widehat{\Sigma}_n) &= \mathcal{U}(\tilde{\theta}, Z_{\tilde{\theta},n}, \widehat{\Sigma}_n) - \mu_{Y,n}(\tilde{\theta}; P). \end{aligned}$$

For brevity, going forward we use the shorthand notation

$$\left( \mathcal{L}(\tilde{\theta}, Z_{\tilde{\theta},n}, \widehat{\Sigma}_n), \mathcal{U}(\tilde{\theta}, Z_{\tilde{\theta},n}, \widehat{\Sigma}_n), \mathcal{L}(\tilde{\theta}, Z_{\tilde{\theta},n}^*, \widehat{\Sigma}_n), \mathcal{U}(\tilde{\theta}, Z_{\tilde{\theta},n}^*, \widehat{\Sigma}_n) \right) = (\mathcal{L}_n, \mathcal{U}_n, \mathcal{L}_n^*, \mathcal{U}_n^*).$$

**Lemma 8**

Under Assumptions 2 and 4, for any  $\{n_s\}$  and  $\{P_{n_s}\}$  satisfying conditions (1)-(3) of Lemma 5 and any  $\tilde{\theta}$  with  $\mu_X^*(\tilde{\theta}) > -\infty$ ,

$$\left( Y_{n_s}^*, \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*, \widehat{\Sigma}_{n_s}, \hat{\theta}_{n_s} \right) \rightarrow_d \left( Y^*, \mathcal{L}^*, \mathcal{U}^*, \Sigma^*, \hat{\theta} \right),$$

where the objects on the right hand side are calculated based on  $(Y^*, X^*, \Sigma^*)$  for

$$\begin{pmatrix} X^* \\ Y^* \end{pmatrix} \sim N(\mu^*, \Sigma^*)$$

with  $\mu^* = (\mu_X^*, 0)'$ .

**Lemma 9**

For  $F_N$  again the standard normal distribution function, the function

$$F_{TN}(Y(\theta); \mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}) = \frac{F_N\left(\frac{Y(\theta) \wedge \mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)}{F_N\left(\frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)} 1(Y(\theta) \geq \mathcal{L}) \quad (45)$$

is continuous in  $(Y(\theta), \mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U})$  on the set

$$\{(Y(\theta), \mu, \Sigma_Y(\theta)) \in \mathbb{R}^3, \mathcal{L} \in \mathbb{R} \cup \{-\infty\}, \mathcal{U} \in \mathbb{R} \cup \{\infty\} : \Sigma_Y(\theta) > 0, \mathcal{L} < Y(\theta) < \mathcal{U}\}.$$

To state the next lemma, let  $(c_l(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}), c_u(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}))$  solve

$$Pr\{\zeta \in [c_l, c_u]\} = 1 - \alpha$$

$$E[\zeta 1\{\zeta \in [c_l, c_u]\}] = (1 - \alpha)E[\zeta]$$

for

$$\zeta \sim \xi | \xi \in [\mathcal{L}, \mathcal{U}], \xi \sim N(\mu, \Sigma_Y(\theta)).$$

**Lemma 10**

The function  $(c_l(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}), c_u(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}))$  satisfies

$$\begin{aligned} & (c_l(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}), c_u(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U})) \\ &= (\mu + c_l(0, \Sigma_Y(\theta), \mathcal{L} - \mu, \mathcal{U} - \mu), \mu + c_u(0, \Sigma_Y(\theta), \mathcal{L} - \mu, \mathcal{U} - \mu)) \end{aligned}$$

and is continuous in  $(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U})$  on the set

$$\{(\mu, \Sigma_Y(\theta)) \in \mathbb{R}^2, \mathcal{L} \in \mathbb{R} \cup \{-\infty\}, \mathcal{U} \in \mathbb{R} \cup \{\infty\} : \Sigma_Y(\theta) > 0, \mathcal{L} < \mathcal{U}\}.$$

**D.1.4 Proofs for Auxiliary Lemmas**

**Proof of Lemma 5** To prove that

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n | C_n(P) = 1 \right\} - \alpha \right| Pr_P \{C_n(P) = 1\} = 0$$

it suffices to show that

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} \left( Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n | C_n(P) = 1 \right\} - \alpha \right) Pr_P \{ C_n(P) = 1 \} \geq 0 \quad (46)$$

and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left( Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n | C_n(P) = 1 \right\} - \alpha \right) Pr_P \{ C_n(P) = 1 \} \leq 0. \quad (47)$$

We prove that to show (46), it suffices to show that for all  $\{n_s\}$ ,  $\{P_{n_s}\}$  satisfying conditions (1)-(3) of the lemma,

$$\liminf_{s \rightarrow \infty} Pr_{P_{n_s}} \left\{ \mu_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{n_s} | C_{n_s}(P_{n_s}) = 1 \right\} \geq \alpha. \quad (48)$$

An argument along the same lines implies that to prove (47) it suffices to show that

$$\limsup_{s \rightarrow \infty} Pr_{P_{n_s}} \left\{ \mu_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{n_s} | C_{n_s}(P_{n_s}) = 1 \right\} \leq \alpha. \quad (49)$$

Note, however, that (48) and (49) together are equivalent to (42).

Towards contradiction, suppose that (46) fails, so

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} \left( Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n | C_n(P) = 1 \right\} - \alpha \right) Pr_P \{ C_n(P) = 1 \} < -\varepsilon,$$

for some  $\varepsilon > 0$  but that (48) holds for all sequences satisfying conditions (1)-(3) of the lemma. Then there exists an increasing sequence of sample sizes  $n_q$  and some sequence  $\{P_{n_q}\}$  with  $P_{n_q} \in \mathcal{P}_{n_q}$  for all  $q$  such that

$$\limsup_{q \rightarrow \infty} \left( Pr_{P_{n_q}} \left\{ \mu_{Y,n_q}(\hat{\theta}_{n_q}; P_{n_q}) \in CS_{n_q} | C_{n_q}(P_{n_q}) = 1 \right\} - \alpha \right) Pr_{P_{n_q}} \{ C_{n_q}(P_{n_q}) = 1 \} < -\varepsilon. \quad (50)$$

We want to show that there exists a further subsequence  $\{n_s\} \subseteq \{n_q\}$  satisfying (1)-(3) in the statement of the lemma, and so establish a contradiction.

Note that since the set  $\mathcal{S}$  defined in (41) is compact (e.g. in the Frobenius norm), and Assumption 3 implies that  $\Sigma(P_{n_q}) \in \mathcal{S}$  for all  $q$ , there exists a further subsequence  $\{n_r\} \subseteq \{n_q\}$  such that

$$\lim_{r \rightarrow \infty} \Sigma(P_{n_r}) \rightarrow \Sigma^*$$

for some  $\Sigma^* \in \mathcal{S}$ .

Note, next, that  $Pr_{P_{n_r}} \{ C_{n_r}(P_{n_r}) = 1 \} \in [0, 1]$  for all  $r$ , and so converges along a subsequence  $\{n_t\} \subseteq \{n_r\}$ . However, (50) implies that  $Pr_{P_{n_r}} \{ C_{n_r}(P_{n_r}) = 1 \} \geq \frac{\varepsilon}{\alpha}$  for all  $r$ , and

thus that

$$Pr_{P_{n_t}}\{C_{n_t}(P_{n_t})=1\}\rightarrow p^*\in\left[\frac{\varepsilon}{\alpha},1\right].$$

Finally, let us define

$$\mu_{X,n}^*(P)=\mu_{X,n}(P)-\max_{\theta}\mu_{X,n}(\theta;P),$$

and note that  $\mu_{X,n}^*(P)\leq 0$  by construction. Since  $\mu_{X,n}^*(P)$  is finite-dimensional and  $\max_{\theta}\mu_{X,n}^*(P;\theta)=0$ , there exists some  $\theta\in\Theta$  such that  $\mu_{X,n}^*(P;\theta)$  is equal to zero infinitely often. Let  $\{n_u\}\subseteq\{n_t\}$  extract the corresponding sequence of sample sizes. The set  $[-\infty,0]^{|\Theta|}$  is compact under the metric  $d(\mu_X,\tilde{\mu}_X)=\|F_N(\mu_X)-F_N(\tilde{\mu}_X)\|$  for  $F_N(\cdot)$  the standard normal cdf applied elementwise, and  $\|\cdot\|$  the Euclidean norm. Hence, there exists a further subsequence  $\{n_s\}\subseteq\{n_u\}$  along which  $\mu_{X,n_s}^*(P_{n_s})$  converges to a limit in this metric. Note, however, that this means that  $\mu_{X,n_s}^*(P_{n_s})$  converges to a limit  $\mu^*\in\mathcal{M}^*$  in the usual metric.

Hence, we have shown that there exists a subsequence  $\{n_s\}\subseteq\{n_q\}$  that satisfies (1)-(3). By supposition, (48) must hold along this subsequence. Thus,

$$\liminf_{n\rightarrow\infty}\left(Pr_{P_{n_s}}\left\{\mu_{Y,n_s}\left(\hat{\theta}_{n_s};P_{n_s}\right)\in CS_{n_s}\mid C_{n_s}(P_{n_s})=1\right\}-\alpha\right)Pr_P\{C_{n_s}(P_{n_s})=1\}\geq 0,$$

which contradicts (50). Hence, we have established a contradiction and so proved that (48) for all subsequences satisfying conditions (1)-(3) of the lemma implies (46). An argument along the same lines shows that (49) along all subsequences satisfying conditions (1)-(3) of lemma implies (47).  $\square$

**Proof of Lemma 6** Let us define

$$C_{n,J+1}(P)=1\{C_{n,j}(P)=0\text{ for all }j\in\{1,\dots,J\}\}.$$

Note that

$$\begin{aligned} & Pr_P\left\{\mu_{Y,n}\left(\hat{\theta}_n;P\right)\in CS_n\right\} \\ &= \sum_{j=1}^{J+1}Pr_P\left\{\mu_{Y,n}\left(\hat{\theta}_n;P\right)\in CS_n\mid C_{n,j}(P)=1\right\}Pr_P\{C_{n,j}(P)=1\}+o(1) \end{aligned}$$

where the  $o(1)$  term is negligible uniformly over  $P\in\mathcal{P}_n$  as  $n\rightarrow\infty$ . Hence,

$$\begin{aligned} & Pr_P\left\{\mu_{Y,n}\left(\hat{\theta}_n;P\right)\in CS_n\right\}-(1-\alpha) \\ &= \sum_{j=1}^{J+1}\left(Pr_P\left\{\mu_{Y,n}\left(\hat{\theta}_n;P\right)\in CS_n\mid C_{n,j}(P)=1\right\}-(1-\alpha)\right)Pr_P\{C_{n,j}(P)=1\}+o(1) \end{aligned}$$

and

$$\begin{aligned}
& \liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n \right\} - (1-\alpha) \\
&= \liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} \sum_{j=1}^{J+1} \left( Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n | C_{n,j}(P) = 1 \right\} - (1-\alpha) \right) Pr_P \{ C_{n,j}(P) = 1 \} \\
&= \liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} \left( Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n | C_{n,J+1}(P) = 1 \right\} - (1-\alpha) \right) Pr_P \{ C_{n,J+1}(P) = 1 \} \\
&\quad \geq -(1-\alpha) \limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \{ C_{n,J+1}(P) = 1 \} \\
&= -(1-\alpha) \left( 1 - \liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} \sum_{j=1}^J Pr_P \{ C_{n,j}(P) = 1 \} \right)
\end{aligned}$$

which immediately implies that

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n \right\} \geq (1-\alpha) \liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} \sum_{j=1}^J Pr_P \{ C_{n,j}(P) = 1 \}.$$

Likewise,

$$\begin{aligned}
& \limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n \right\} - (1-\alpha) \\
&= \limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \sum_{j=1}^{J+1} \left( Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n | C_{n,j}(P) = 1 \right\} - (1-\alpha) \right) Pr_P \{ C_{n,j}(P) = 1 \} \\
&= \limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left( Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n | C_{n,J+1}(P) = 1 \right\} - (1-\alpha) \right) Pr_P \{ C_{n,J+1}(P) = 1 \} \\
&\leq \alpha \cdot \limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \{ C_{n,J+1}(P) = 1 \} = \alpha \left( 1 - \liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} \sum_{j=1}^J Pr_P \{ C_{n,j}(P) = 1 \} \right).
\end{aligned}$$

This immediately implies that

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n \right\} \leq 1 - \alpha \cdot \liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} \sum_{j=1}^J Pr_P \{ C_{n,j}(P) = 1 \},$$

as we wanted to show.  $\square$

**Proof of Lemma 7** Note that

$$Z_{\tilde{\theta},n}^* = Z_{\tilde{\theta},n} - \max_{\theta} \mu_{X,n}(\theta; P) + \widehat{\Sigma}_{XY,n}(\cdot, \tilde{\theta}) \frac{\mu_{Y,n}(\tilde{\theta}; P)}{\widehat{\Sigma}_{Y,n}(\tilde{\theta})},$$

so

$$Z_{\tilde{\theta},n}^*(\theta) - Z_{\tilde{\theta},n}^*(\tilde{\theta}) = Z_{\tilde{\theta},n}(\theta) - Z_{\tilde{\theta},n}(\tilde{\theta}) + \left( \widehat{\Sigma}_{XY,n}(\theta, \tilde{\theta}) - \widehat{\Sigma}_{XY,n}(\tilde{\theta}, \tilde{\theta}) \right) \frac{\mu_{Y,n}(\tilde{\theta}; P)}{\widehat{\Sigma}_{Y,n}(\tilde{\theta})}.$$

The result follows immediately.  $\square$

**Proof of Lemma 8** By Assumption 4

$$\begin{pmatrix} X_{n_s} - \mu_{X,n_s}(P_{n_s}) \\ Y_{n_s} - \mu_{Y,n_s}(P_{n_s}) \end{pmatrix} \rightarrow_d N(0, \Sigma^*).$$

Hence, by Slutsky's lemma

$$\begin{pmatrix} X_{n_s}^* \\ Y_{n_s}^* \end{pmatrix} = \begin{pmatrix} X_{n_s} - \max_{\theta} \mu_{X,n_s}(\theta; P_{n_s}) \\ Y_{n_s} - \mu_{Y,n_s}(P_{n_s}) \end{pmatrix} \rightarrow_d \begin{pmatrix} X^* \\ Y^* \end{pmatrix} \sim N(\mu^*, \Sigma^*).$$

We begin by considering one  $\theta \in \Theta \setminus \{\tilde{\theta}\}$  at a time. Since  $\widehat{\Sigma}_{n_s} \rightarrow_p \Sigma^*$  by Assumption 2, if  $\Sigma_{XY}^*(\tilde{\theta}) - \Sigma_{XY}^*(\tilde{\theta}, \theta) \neq 0$  then

$$\frac{\widehat{\Sigma}_{Y,n_s}(\tilde{\theta}) \left( Z_{\tilde{\theta},n_s}^*(\theta) - Z_{\tilde{\theta},n_s}^*(\tilde{\theta}) \right)}{\widehat{\Sigma}_{XY,n_s}(\tilde{\theta}) - \widehat{\Sigma}_{XY,n_s}(\tilde{\theta}, \theta)} \rightarrow_d \frac{\Sigma_Y^*(\tilde{\theta}) \left( Z_{\tilde{\theta}}^*(\theta) - Z_{\tilde{\theta}}^*(\tilde{\theta}) \right)}{\Sigma_{XY}^*(\tilde{\theta}) - \Sigma_{XY}^*(\tilde{\theta}, \theta)},$$

where the terms on the right hand side are based on  $(X^*, Y^*, \Sigma^*)$ . The limit is finite if  $\mu_X^*(\theta) > -\infty$ , while otherwise  $\mu_X^*(\theta) = -\infty$  and

$$\frac{\Sigma_Y^*(\tilde{\theta}) \left( Z_{\tilde{\theta}}^*(\theta) - Z_{\tilde{\theta}}^*(\tilde{\theta}) \right)}{\Sigma_{XY}^*(\tilde{\theta}) - \Sigma_{XY}^*(\tilde{\theta}, \theta)} = \begin{cases} -\infty & \text{if } \Sigma_{XY}^*(\tilde{\theta}) - \Sigma_{XY}^*(\tilde{\theta}, \theta) > 0 \\ +\infty & \text{if } \Sigma_{XY}^*(\tilde{\theta}) - \Sigma_{XY}^*(\tilde{\theta}, \theta) < 0 \end{cases}.$$

If instead  $\Sigma_{XY}^*(\tilde{\theta}) - \Sigma_{XY}^*(\tilde{\theta}, \theta) = 0$ , then since  $\Sigma_X^*$  has full rank,

$$Z_{\tilde{\theta}}^*(\theta) - Z_{\tilde{\theta}}^*(\tilde{\theta}) = X^*(\theta) - X^*(\tilde{\theta})$$

is normally distributed with non-zero variance. Hence, in this case

$$\left| \frac{\widehat{\Sigma}_{Y, n_s}(\tilde{\theta}) \left( Z_{n_s, \tilde{\theta}}^*(\theta) - Z_{n_s, \tilde{\theta}}^*(\tilde{\theta}) \right)}{\widehat{\Sigma}_{XY, n_s}(\tilde{\theta}) - \widehat{\Sigma}_{XY, n_s}(\tilde{\theta}, \theta)} \right| \rightarrow \infty. \quad (51)$$

Let us define

$$\Theta^*(\tilde{\theta}) = \left\{ \theta \in \Theta \setminus \tilde{\theta} : \Sigma_{XY}^*(\tilde{\theta}) - \Sigma_{XY}^*(\tilde{\theta}, \theta) \neq 0 \right\}.$$

The argument above implies that

$$\begin{aligned} & \max_{\theta \in \Theta^*(\tilde{\theta}) : \widehat{\Sigma}_{XY, n_s}(\tilde{\theta}) > \widehat{\Sigma}_{XY, n_s}(\tilde{\theta}, \theta)} \frac{\widehat{\Sigma}_{Y, n_s}(\tilde{\theta}) \left( Z_{\tilde{\theta}, n_s}^*(\theta) - Z_{\tilde{\theta}, n_s}^*(\tilde{\theta}) \right)}{\widehat{\Sigma}_{XY, n_s}(\tilde{\theta}) - \widehat{\Sigma}_{XY, n_s}(\tilde{\theta}, \theta)} \\ \rightarrow_d \mathcal{L}^* &= \max_{\theta \in \Theta : \Sigma_{XY}^*(\tilde{\theta}) > \Sigma_{XY}^*(\tilde{\theta}, \theta)} \frac{\Sigma_Y^*(\tilde{\theta}) \left( Z_{\tilde{\theta}}^*(\theta) - Z_{\tilde{\theta}}^*(\tilde{\theta}) \right)}{\Sigma_{XY}^*(\tilde{\theta}) - \Sigma_{XY}^*(\tilde{\theta}, \theta)}, \end{aligned}$$

and

$$\begin{aligned} & \min_{\theta \in \Theta^*(\tilde{\theta}) : \widehat{\Sigma}_{XY, n_s}(\tilde{\theta}) < \widehat{\Sigma}_{XY, n_s}(\tilde{\theta}, \theta)} \frac{\widehat{\Sigma}_{Y, n_s}(\tilde{\theta}) \left( Z_{\tilde{\theta}, n_s}^*(\theta) - Z_{\tilde{\theta}, n_s}^*(\tilde{\theta}) \right)}{\widehat{\Sigma}_{XY, n_s}(\tilde{\theta}) - \widehat{\Sigma}_{XY, n_s}(\tilde{\theta}, \theta)} \\ \rightarrow_d \mathcal{U}^* &= \min_{\theta \in \Theta : \Sigma_{XY}^*(\tilde{\theta}) < \Sigma_{XY}^*(\tilde{\theta}, \theta)} \frac{\Sigma_Y^*(\tilde{\theta}) \left( Z_{\tilde{\theta}}^*(\theta) - Z_{\tilde{\theta}}^*(\tilde{\theta}) \right)}{\Sigma_{XY}^*(\tilde{\theta}) - \Sigma_{XY}^*(\tilde{\theta}, \theta)}. \end{aligned}$$

By (51), the same convergence holds when we minimize and maximize over  $\Theta$  rather than  $\Theta^*(\tilde{\theta})$ . Hence,

$$(\mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*) \rightarrow_d (\mathcal{L}^*, \mathcal{U}^*).$$

Moreover,  $\hat{\theta}_{n_s}$  is almost everywhere continuous in  $X_{n_s}^*$ , so

$$\left( Y_{n_s}^*, \widehat{\Sigma}_{n_s}, \hat{\theta}_{n_s} \right) \rightarrow_d \left( Y^*, \Sigma^*, \hat{\theta} \right)$$

by the continuous mapping theorem, and this convergence holds jointly with that for

$(\mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*)$ . Hence, we have established the desired convergence.  $\square$

**Proof of Lemma 9** Continuity for  $\Sigma_Y(\theta) > 0, \mathcal{L} < Y(\theta) < \mathcal{U}$  with all elements finite is immediate from the functional form. Moreover, for fixed  $(Y(\theta), \mu, \Sigma_Y(\theta)) \in \mathbb{R}^3$  with  $\Sigma_Y(\theta) > 0$  and  $\mathcal{L} < Y(\theta) < \mathcal{U}$ ,

$$\begin{aligned} \lim_{\mathcal{U} \rightarrow \infty} \frac{F_N\left(\frac{Y(\theta) \wedge \mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)}{F_N\left(\frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)} 1(Y(\theta) \geq \mathcal{L}) &= \frac{F_N\left(\frac{Y(\theta) - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)}{F_N\left(\frac{\infty}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)} \\ \lim_{\mathcal{L} \rightarrow -\infty} \frac{F_N\left(\frac{Y(\theta) \wedge \mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)}{F_N\left(\frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)} 1(Y(\theta) \geq \mathcal{L}) &= \frac{F_N\left(\frac{Y(\theta) - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{-\infty}{\sqrt{\Sigma_Y(\theta)}}\right)}{F_N\left(\frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{-\infty}{\sqrt{\Sigma_Y(\theta)}}\right)} \end{aligned}$$

and

$$\lim_{(\mathcal{L}, \mathcal{U}) \rightarrow (-\infty, \infty)} \frac{F_N\left(\frac{Y(\theta) \wedge \mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)}{F_N\left(\frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)} 1(Y(\theta) \geq \mathcal{L}) = \frac{F_N\left(\frac{Y(\theta) - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{-\infty}{\sqrt{\Sigma_Y(\theta)}}\right)}{F_N\left(\frac{\infty}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{-\infty}{\sqrt{\Sigma_Y(\theta)}}\right)}.$$

Hence, we obtain the desired result.  $\square$

**Proof of Lemma 10** Note that for  $f_N$  again the standard normal density,

$$\begin{aligned} Pr\{\zeta \in [c_l, c_u]\} &= \frac{F_N\left(\frac{\mathcal{U} \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)}{F_N\left(\frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)} 1(\mathcal{U} \geq c_l, c_u \geq \mathcal{L}), \\ E[\zeta 1\{\zeta \in [c_l, c_u]\}] &= Pr\{\zeta \in [c_l, c_u]\} \left[ \mu + \frac{\sqrt{\Sigma_Y(\theta)} \left( f_N\left(\frac{\mathcal{L} \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - f_N\left(\frac{\mathcal{U} \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}{F_N\left(\frac{\mathcal{U} \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)} \right] \\ &= \frac{\mu \left( F_N\left(\frac{\mathcal{U} \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right) + \sqrt{\Sigma_Y(\theta)} \left( f_N\left(\frac{\mathcal{L} \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - f_N\left(\frac{\mathcal{U} \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}{F_N\left(\frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}}\right)} \end{aligned}$$

and

$$E[\zeta] = \mu + \frac{\sqrt{\Sigma_Y(\theta)} \left( f_N \left( \frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - f_N \left( \frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) \right)}{F_N \left( \frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - F_N \left( \frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right)}.$$

Thus, we can write  $(c_l(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}), c_u(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}))$  as the solution to the following system of equations:

$$F_N \left( \frac{\mathcal{U} \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - F_N \left( \frac{\mathcal{L} \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - (1 - \alpha) \left( F_N \left( \frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - F_N \left( \frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) \right) = 0 \quad (52)$$

and

$$\begin{aligned} \mu \left( F_N \left( \frac{\mathcal{U} \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - F_N \left( \frac{\mathcal{L} \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) \right) + \sqrt{\Sigma_Y(\theta)} \left( f_N \left( \frac{\mathcal{L} \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - f_N \left( \frac{\mathcal{U} \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) \right) \\ - (1 - \alpha) \mu \left( F_N \left( \frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - F_N \left( \frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) \right) \\ - (1 - \alpha) \sqrt{\Sigma_Y(\theta)} \left( f_N \left( \frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - f_N \left( \frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) \right) = 0 \end{aligned}$$

such that  $c_l \leq \mathcal{U}$  and  $c_u \geq \mathcal{L}$ . Note, however, that since any  $c = (c_l, c_u)$  that solves this system must satisfy (52), we can also write

$$(c_l(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}), c_u(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}))$$

as the solution to

$$g(c; \mu, \sqrt{\Sigma_Y(\theta)}, \mathcal{L}, \mathcal{U}) = 0$$

such that  $c_l \leq \mathcal{U}$  and  $c_u \geq \mathcal{L}$ , for

$$g(c; \mu, \sqrt{\Sigma_Y(\theta)}, \mathcal{L}, \mathcal{U}) = \begin{pmatrix} F_N \left( \frac{\mathcal{U} \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - F_N \left( \frac{\mathcal{L} \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - (1 - \alpha) \left( F_N \left( \frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - F_N \left( \frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) \right) \\ f_N \left( \frac{\mathcal{L} \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - f_N \left( \frac{\mathcal{U} \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - (1 - \alpha) \left( f_N \left( \frac{\mathcal{L} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - f_N \left( \frac{\mathcal{U} - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) \right) \end{pmatrix}.$$

This implies that

$$g\left(c; \mu, \sqrt{\Sigma_Y(\theta)}, \mathcal{L}, \mathcal{U}\right) = g\left(c - (\mu, \mu)'; 0, \sqrt{\Sigma_Y(\theta)}, \mathcal{L} - \mu, \mathcal{U} - \mu\right),$$

from which the first result of the lemma follows immediately.

To prove the second part of the lemma, note that by the first part of the lemma it suffices to prove continuity of

$$(c_l(0, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}), c_u(0, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U})). \quad (53)$$

Recall that (53) solves

$$Pr\{\zeta \in [c_l, c_u]\} = (1 - \alpha) \quad (54)$$

and

$$E[\zeta 1\{\zeta \in [c_l, c_u]\}] = (1 - \alpha)E[\zeta] \quad (55)$$

for  $\zeta \sim \xi | \xi \in [\mathcal{L}, \mathcal{U}]$  where  $\xi \sim N(0, \Sigma_Y(\theta))$ . Note, however, that since  $\mathcal{L} < \mathcal{U}$ , (54) implies that any solution has  $c_l < c_u$ , and that we cannot have both  $c_l \leq \mathcal{L}$  and  $c_u \geq \mathcal{U}$ . Note, next, that if  $c_l = \mathcal{L}$ , then since  $c_u < \mathcal{U}$ ,  $E[\zeta | \zeta \in [c_l, c_u]] < E[\zeta]$ , and thus that  $E[\zeta 1\{\zeta \in [c_l, c_u]\}] < (1 - \alpha)E[\zeta]$ . Since the same argument applies when  $c_u = \mathcal{U}$ , we see that for any solution (53),  $\mathcal{L} < c_l < c_u < \mathcal{U}$ .

Note, next, that  $g\left(c; 0, \sqrt{\Sigma_Y(\theta)}, \mathcal{L}, \mathcal{U}\right)$  is almost everywhere differentiable with respect to  $c$  with derivative

$$\frac{\partial}{\partial c} g\left(c; 0, \sqrt{\Sigma_Y(\theta)}, \mathcal{L}, \mathcal{U}\right) = \begin{pmatrix} -1(c_l > \mathcal{L})f_N\left(c_l/\sqrt{\Sigma_Y(\theta)}\right)/\sqrt{\Sigma_Y(\theta)} & 1(c_u < \mathcal{U})f_N\left(c_u/\sqrt{\Sigma_Y(\theta)}\right)/\sqrt{\Sigma_Y(\theta)} \\ -1(c_l > \mathcal{L})c_l f_N\left(c_l/\sqrt{\Sigma_Y(\theta)}\right)/\Sigma_Y(\theta) & 1(c_u < \mathcal{U})c_u f_N\left(c_u/\sqrt{\Sigma_Y(\theta)}\right)/\Sigma_Y(\theta) \end{pmatrix}.$$

The first row is zero if and only if  $c_l < \mathcal{L}$  and  $c_u > \mathcal{U}$ , which as argued above cannot be a solution to  $g\left(c; 0, \sqrt{\Sigma_Y(\theta)}, \mathcal{L}, \mathcal{U}\right) = 0$  for  $\mathcal{L} < \mathcal{U}$  finite. The second row is zero if and only if either (i)  $c_l < \mathcal{L}$  and  $c_u > \mathcal{U}$  or (ii)  $c_l = c_u = 0$ , which again cannot be a solution. Finally, apart from the cases just mentioned, the rows are proportional if and only if either (i)  $c_l < \mathcal{L}$ , (ii)  $c_u > \mathcal{U}$  or (iii)  $c_l = c_u$ , none of which can be a solution. Hence, the implicit function theorem implies continuity on

$$\{\Sigma_Y(\theta) \in \mathbb{R}, \mathcal{L} \in \mathbb{R}, \mathcal{U} \in \mathbb{R} : \Sigma_Y(\theta) > 0, \mathcal{L} < \mathcal{U}\}.$$

To complete the proof, we need to establish continuity at infinity. Note, however, that we can write

$$g\left(c;0,\sqrt{\Sigma_Y(\theta)},\mathcal{L},\mathcal{U}\right)=\tilde{g}(c;0,\Sigma_Y(\theta),F_N(\mathcal{L}),F_N(\mathcal{U}))$$

where  $\tilde{g}$  is continuous in all arguments and  $F_N(\cdot)$  is continuous at infinity. Hence, another application of implicit function theorem implies that

$$(c_l(0,\Sigma_Y(\theta),\mathcal{L},\mathcal{U}),c_u(0,\Sigma_Y(\theta),\mathcal{L},\mathcal{U}))$$

are continuous on

$$\{\Sigma_Y(\theta) > 0, \mathcal{L} < \mathcal{U} : (\Sigma_Y(\theta), Y(\theta)) \in \mathbb{R}^2, \mathcal{L} \in \mathbb{R} \cup \{-\infty\}, \mathcal{U} \in \mathbb{R} \cup \{\infty\}\},$$

as we wanted to show.  $\square$

### D.1.5 Proofs for Uniformity Results

**Proof of Proposition 9** Note that

$$\hat{\mu}_{\alpha,n} \geq \mu_{Y,n}(\hat{\theta}_n; P) \iff \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,-,n}$$

for  $CS_{U,-,n} = (-\infty, \hat{\mu}_{\alpha,n}]$ . Hence, by Lemma 5, to prove that (31) holds it suffices to show that for all  $\{n_s\}$  and  $\{P_{n_s}\}$  such that conditions (1)-(3) of the lemma hold with  $C_n(P) = 1\{\hat{\theta}_n = \tilde{\theta}\}$ , we have

$$\lim_{s \rightarrow \infty} Pr_{P_{n_s}} \left\{ \hat{\mu}_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{U,-,n_s} | \hat{\theta}_{n_s} = \tilde{\theta} \right\} = \alpha. \quad (56)$$

To this end, recall that for  $F_{TN}(Y(\theta); \mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U})$  as defined in (45), the estimator  $\hat{\mu}_{\alpha,n}$  solves

$$F_{TN}\left(Y_n(\hat{\theta}_n); \mu, \widehat{\Sigma}_{Y,n}(\hat{\theta}_n), \mathcal{L}_n, \mathcal{U}_n\right) = 1 - \alpha,$$

where  $(\mathcal{L}_n, \mathcal{U}_n)$  are defined following Lemma 7. This cdf is strictly decreasing in  $\mu$  as argued in the proof of Proposition 8, and is increasing in  $Y_n(\hat{\theta})$ . Hence,  $\hat{\mu}_{\alpha,n} \geq \mu_{Y,n}(\hat{\theta}_n; P)$  if and only if

$$F_{TN}\left(Y_n(\hat{\theta}_n); \mu_{Y,n}(\hat{\theta}_n; P), \widehat{\Sigma}_{Y,n}(\hat{\theta}_n), \mathcal{L}_n, \mathcal{U}_n\right) \geq 1 - \alpha.$$

Note, next, that by Lemma 7 and the form of the function  $F_{TN}$ ,

$$F_{TN}\left(Y_n\left(\hat{\theta}_n\right); \mu_{Y,n}\left(\hat{\theta}_n; P\right), \widehat{\Sigma}_{Y,n}\left(\hat{\theta}_n\right), \mathcal{L}_n, \mathcal{U}_n\right) = F_{TN}\left(Y_n^*\left(\hat{\theta}_n\right); 0, \widehat{\Sigma}_{Y,n}\left(\hat{\theta}_n\right), \mathcal{L}_n^*, \mathcal{U}_n^*\right),$$

so  $\hat{\mu}_{\alpha,n} \geq \mu_{Y,n}\left(\hat{\theta}_n; P\right)$  if and only if

$$F_{TN}\left(Y_n^*\left(\hat{\theta}_n\right); 0, \widehat{\Sigma}_{Y,n}\left(\hat{\theta}_n\right), \mathcal{L}_n^*, \mathcal{U}_n^*\right) \geq 1 - \alpha.$$

Lemma 8 shows that  $\left(Y_{n_s}^*\left(\hat{\theta}_{n_s}\right), \widehat{\Sigma}_{Y,n_s}\left(\hat{\theta}_{n_s}\right), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*, \hat{\theta}_{n_s}\right)$  converges in distribution as  $s \rightarrow \infty$ , so since  $F_{TN}$  is continuous by Lemma 9 while  $\operatorname{argmax}_{\theta} X^*(\theta)$  is almost surely unique and continuous for  $X^*$  as in Lemma 8, the continuous mapping theorem implies that

$$\begin{aligned} & \left(F_{TN}\left(Y_{n_s}^*\left(\hat{\theta}_{n_s}\right); 0, \widehat{\Sigma}_{Y,n_s}\left(\hat{\theta}_{n_s}\right), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*\right), 1\left\{\hat{\theta}_{n_s} = \tilde{\theta}\right\}\right) \\ & \rightarrow_d \left(F_{TN}\left(Y^*\left(\hat{\theta}\right); 0, \Sigma_Y^*\left(\hat{\theta}\right), \mathcal{L}^*, \mathcal{U}^*\right), 1\left\{\hat{\theta} = \tilde{\theta}\right\}\right). \end{aligned}$$

Since we can write

$$\begin{aligned} & Pr_{P_{n_s}} \left\{ F_{TN}\left(Y_{n_s}^*\left(\hat{\theta}_{n_s}\right); 0, \widehat{\Sigma}_{Y,n_s}\left(\hat{\theta}_{n_s}\right), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*\right) \geq 1 - \alpha \mid \hat{\theta}_{n_s} = \tilde{\theta} \right\} \\ & = \frac{E_{P_{n_s}} \left[ 1\left\{ F_{TN}\left(Y_{n_s}^*\left(\hat{\theta}_{n_s}\right); 0, \widehat{\Sigma}_{Y,n_s}\left(\hat{\theta}_{n_s}\right), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*\right) \geq 1 - \alpha \right\} 1\left\{ \hat{\theta}_{n_s} = \tilde{\theta} \right\} \right]}{E_{P_{n_s}} \left[ 1\left\{ \hat{\theta}_{n_s} = \tilde{\theta} \right\} \right]}, \end{aligned}$$

and by construction (see also Proposition 1 in the main text),

$$F_{TN}\left(Y^*\left(\hat{\theta}\right); 0, \Sigma_Y^*\left(\hat{\theta}\right), \mathcal{L}^*, \mathcal{U}^*, \hat{\theta}\right) \mid \hat{\theta} = \tilde{\theta} \sim U[0,1],$$

and  $Pr\left\{\hat{\theta} = \tilde{\theta}\right\} = p^* > 0$ , we thus have that

$$\begin{aligned} & Pr_{P_{n_s}} \left\{ F_{TN}\left(Y_{n_s}^*\left(\hat{\theta}_{n_s}\right); 0, \widehat{\Sigma}_{Y,n_s}\left(\hat{\theta}_{n_s}\right), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*\right) \geq 1 - \alpha \mid \hat{\theta}_{n_s} = \tilde{\theta} \right\} \\ & \rightarrow Pr\left\{ F_{TN}\left(Y^*\left(\hat{\theta}\right); 0, \Sigma_Y^*\left(\hat{\theta}\right), \mathcal{L}^*, \mathcal{U}^*\right) \geq 1 - \alpha \mid \hat{\theta} = \tilde{\theta} \right\} = \alpha, \end{aligned}$$

which verifies (56).

Since this argument holds for all  $\tilde{\theta} \in \Theta$ , and Assumptions 3 and 4 imply that for all

$\theta, \tilde{\theta} \in \Theta$  with  $\theta \neq \tilde{\theta}$ ,

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \left\{ X_n(\theta) = X_n(\tilde{\theta}) \right\} = 0,$$

Lemma 6 implies (32).  $\square$

**Proof of Corollary 1** By construction,  $CS_{ET,n} = [\hat{\mu}_{\alpha/2,n}, \hat{\mu}_{1-\alpha/2,n}]$ , and  $\hat{\mu}_{1-\alpha/2,n} > \hat{\mu}_{\alpha/2,n}$  for all  $\alpha < 1$ . Hence,

$$\begin{aligned} & Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n} | \hat{\theta}_n = \tilde{\theta} \right\} \\ &= Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \leq \hat{\mu}_{1-\alpha/2,n} | \hat{\theta}_n = \tilde{\theta} \right\} - Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \leq \hat{\mu}_{\alpha/2,n} | \hat{\theta}_n = \tilde{\theta} \right\}, \end{aligned}$$

so the result is immediate from Proposition 9 and Lemma 6.  $\square$

**Proof of Proposition 10** Note that by the definition of  $CS_{U,n}$

$$\begin{aligned} & \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n} \\ \iff & Y_n(\hat{\theta}_n) \in \left[ c_l(\mu_{Y,n}(\hat{\theta}_n; P), \hat{\Sigma}_{Y,n}(\hat{\theta}_n), \mathcal{L}_n, \mathcal{U}_n), c_u(\mu_{Y,n}(\hat{\theta}_n; P), \hat{\Sigma}_{Y,n}(\hat{\theta}_n), \mathcal{L}_n, \mathcal{U}_n) \right] \end{aligned}$$

where

$$(c_l(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}), c_u(\mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U}))$$

are defined immediately before Lemma 10. Hence, by Lemmas 7 and 10,

$$\begin{aligned} & \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n} \\ \iff & Y_n^*(\hat{\theta}_n) \in \left[ c_l(0, \hat{\Sigma}_{Y,n}(\hat{\theta}_n), \mathcal{L}_n^*, \mathcal{U}_n^*), c_u(0, \hat{\Sigma}_{Y,n}(\hat{\theta}_n), \mathcal{L}_n^*, \mathcal{U}_n^*) \right]. \end{aligned}$$

By Lemma 5, to prove that (33) holds it suffices to show that for all  $\{n_s\}$  and  $\{P_{n_s}\}$  satisfying conditions (1)-(3) of Lemma 5,

$$\lim_{s \rightarrow \infty} Pr_{P_{n_s}} \left\{ \mu_{Y,n_s}(\hat{\theta}_{n_s}) \in CS_{U,n_s} | \hat{\theta}_{n_s} = \tilde{\theta} \right\} = 1 - \alpha.$$

Thus, it suffices to show that

$$\lim_{s \rightarrow \infty} Pr_{P_{n_s}} \left\{ Y_{n_s}^*(\hat{\theta}_{n_s}) \in \left[ c_l(0, \hat{\Sigma}_{Y,n_s}(\hat{\theta}_{n_s}), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*), c_u(0, \hat{\Sigma}_{Y,n_s}(\hat{\theta}_{n_s}), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*) \right] \mid \hat{\theta}_{n_s} = \tilde{\theta} \right\} = 1 - \alpha.$$

To this end, note that by Lemma 8,

$$\left(Y_{n_s}^*, \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*, \widehat{\Sigma}_{n_s}, 1\{\hat{\theta}_{n_s} = \tilde{\theta}\}\right) \rightarrow_d \left(Y^*, \mathcal{L}^*, \mathcal{U}^*, \Sigma^*, 1\{\hat{\theta} = \tilde{\theta}\}\right),$$

and thus, by Lemma 10 and the continuous mapping theorem, that

$$\begin{aligned} & \left(Y_{n_s}^*(\tilde{\theta}), c_l\left(0, \widehat{\Sigma}_{Y, n_s}(\tilde{\theta}), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*\right), c_u\left(0, \widehat{\Sigma}_{Y, n_s}(\tilde{\theta}), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*\right), 1\{\hat{\theta}_{n_s} = \tilde{\theta}\}\right) \\ & \rightarrow_d \left(Y^*(\tilde{\theta}), c_l\left(0, \Sigma_Y^*(\tilde{\theta}), \mathcal{L}^*, \mathcal{U}^*\right), c_u\left(0, \Sigma_Y^*(\tilde{\theta}), \mathcal{L}^*, \mathcal{U}^*\right), 1\{\hat{\theta} = \tilde{\theta}\}\right). \end{aligned}$$

By construction (see also Proposition 2 in the main text),

$$Pr\left\{Y^*(\tilde{\theta}) \in \left[c_l\left(0, \mathcal{L}^*, \mathcal{U}^*, \Sigma_Y^*(\tilde{\theta})\right), c_u\left(0, \mathcal{L}^*, \mathcal{U}^*, \Sigma_Y^*(\tilde{\theta})\right)\right] \mid \hat{\theta} = \tilde{\theta}\right\} = 1 - \alpha,$$

and  $Y^*(\tilde{\theta}) \mid \hat{\theta} = \tilde{\theta}, \mathcal{L}^*, \mathcal{U}^*$  follows a truncated normal distribution, so

$$Pr\left\{Y^*(\tilde{\theta}) = c_l\left(0, \Sigma_Y^*(\tilde{\theta}), \mathcal{L}^*, \mathcal{U}^*\right)\right\} = Pr\left\{Y^*(\tilde{\theta}) = c_u\left(0, \Sigma_Y^*(\tilde{\theta}), \mathcal{L}^*, \mathcal{U}^*\right)\right\} = 0.$$

Hence,

$$\begin{aligned} & Pr_{P_{n_s}}\left\{Y_{n_s}^*(\hat{\theta}_{n_s}) \in \left[c_l\left(0, \widehat{\Sigma}_{Y, n_s}(\hat{\theta}_{n_s}), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*\right), c_u\left(0, \widehat{\Sigma}_{Y, n_s}(\hat{\theta}_{n_s}), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*\right)\right] \mid \hat{\theta}_{n_s} = \tilde{\theta}\right\} \\ & = \frac{E_{P_{n_s}}\left[1\{Y_{n_s}^*(\hat{\theta}_{n_s}) \in [c_l(0, \widehat{\Sigma}_{Y, n_s}(\hat{\theta}_{n_s}), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*), c_u(0, \widehat{\Sigma}_{Y, n_s}(\hat{\theta}_{n_s}), \mathcal{L}_{n_s}^*, \mathcal{U}_{n_s}^*)]\} 1\{\hat{\theta}_{n_s} = \tilde{\theta}\}\right]}{E_{P_{n_s}}\left[1\{\hat{\theta}_{n_s} = \tilde{\theta}\}\right]} \\ & \rightarrow \frac{E\left[1\{Y^*(\tilde{\theta}) \in [c_l(0, \Sigma_Y^*(\tilde{\theta}), \mathcal{L}^*, \mathcal{U}^*), c_u(0, \Sigma_Y^*(\tilde{\theta}), \mathcal{L}^*, \mathcal{U}^*)]\} 1\{\hat{\theta} = \tilde{\theta}\}\right]}{E\left[1\{\hat{\theta} = \tilde{\theta}\}\right]} = 1 - \alpha, \end{aligned}$$

as we wanted to show, so (33) follows by Lemma 5.

Since this result again holds for all  $\tilde{\theta} \in \Theta$ , (34) follows immediately by the same argument as in the proof of Proposition 9.  $\square$

**Proof of Proposition 11** By the same argument as in the proof of Lemma 5, to show that (35) holds it suffices to show that for all  $\{n_s\}$ ,  $\{P_{n_s}\}$  satisfying conditions (1)-(3) of Lemma 5,

$$\liminf_{n \rightarrow \infty} Pr_{P_{n_s}}\left\{\mu_{Y, n_s}\left(\hat{\theta}_{n_s}; P_{n_s}\right) \in CS_{P_{n_s}}\right\} \geq 1 - \alpha.$$

To this end, note that

$$\begin{aligned} & \mu_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{P,n_s} \\ \iff & Y_{n_s}^*(\hat{\theta}_{n_s}) \in \left[ -c_\alpha(\widehat{\Sigma}_{Y,n_s}) \sqrt{\widehat{\Sigma}_Y(\hat{\theta}_{n_s})}, c_\alpha(\widehat{\Sigma}_{Y,n_s}) \sqrt{\widehat{\Sigma}_Y(\hat{\theta}_{n_s})} \right] \end{aligned}$$

for  $c_\alpha(\Sigma_Y)$  the  $1-\alpha$  quantile of  $\max_\theta |\xi(\theta)| / \sqrt{\Sigma_Y(\theta)}$  where  $\xi \sim N(0, \Sigma_Y)$ . Next, note that  $c_\alpha(\Sigma_Y)$  is continuous in  $\Sigma$  on  $\mathcal{S}$  as defined in (41). Hence, for all  $\theta$ ,  $c_\alpha(\Sigma_Y) \sqrt{\Sigma_Y(\theta)}$  is continuous as well. Assumptions 2 and 4 imply that

$$\left( Y_{n_s}^*, \widehat{\Sigma}_{n_s}, \hat{\theta}_{n_s} \right) \rightarrow_d \left( Y^*, \Sigma^*, \hat{\theta} \right),$$

which by the continuous mapping theorem implies

$$\left( Y_{n_s}^*(\hat{\theta}_{n_s}), c_\alpha(\widehat{\Sigma}_{Y,n_s}) \sqrt{\widehat{\Sigma}_Y(\hat{\theta}_{n_s})} \right) \rightarrow_d \left( Y^*(\hat{\theta}), c_\alpha(\Sigma_Y^*) \sqrt{\Sigma_Y^*(\hat{\theta})} \right).$$

Hence, since  $Pr \left\{ \left| Y^*(\hat{\theta}) \right| - c_\alpha(\Sigma_Y^*) \sqrt{\Sigma_Y^*(\hat{\theta})} = 0 \right\} = 0$ ,

$$Pr_{P_{n_s}} \left\{ \mu_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{P,n_s} \right\} \rightarrow Pr \left\{ Y^*(\hat{\theta}) \in \left[ -c_\alpha(\Sigma_Y^*) \sqrt{\Sigma_Y^*(\hat{\theta})}, c_\alpha(\Sigma_Y^*) \sqrt{\Sigma_Y^*(\hat{\theta})} \right] \right\} \quad (57)$$

where the right hand side is at least  $1-\alpha$  by construction.  $\square$

**Proof of Proposition 12** Note that

$$\hat{\mu}_{\alpha,n}^H \geq \mu_{Y,n}(\hat{\theta}_n; P) \iff \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,-,n}^H$$

for  $CS_{U,-,n}^H = (-\infty, \hat{\mu}_{\alpha,n}^H]$ . Hence, by Lemma 5, to prove that (36) holds it suffices to show that for all  $\{n_s\}$  and  $\{P_{n_s}\}$  such that conditions (1)-(3) of the lemma hold with  $C_n(P) = 1 \left\{ \hat{\theta}_n = \tilde{\theta}, \mu_{Y,n}(\hat{\theta}_n; P_n) \in CS_{P,n}^\beta \right\}$ , we have

$$\lim_{s \rightarrow \infty} Pr_{P_{n_s}} \left\{ \hat{\mu}_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{U,-,n_s}^H \mid \hat{\theta}_{n_s} = \tilde{\theta}, \mu_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{P,n_s}^\beta \right\} = \alpha.$$

Recall that for  $F_{TN}(Y(\theta); \mu, \Sigma_Y(\theta), \mathcal{L}, \mathcal{U})$  defined as in (45),  $\hat{\mu}_{\alpha,n}^H$  solves

$$F_{TN} \left( Y_n(\hat{\theta}_n); \mu, \widehat{\Sigma}_{Y,n}(\hat{\theta}_n), \mathcal{L}_n^H(\mu), \mathcal{U}_n^H(\mu) \right) = 1 - \alpha,$$

for

$$\begin{aligned}\mathcal{L}_n^H(\mu) &= \max \left\{ \mathcal{L}_n, \mu - c_\alpha \left( \widehat{\Sigma}_{Y,n} \right) \sqrt{\widehat{\Sigma}_Y \left( \hat{\theta}_n \right)} \right\} \\ \mathcal{U}_n^H(\mu) &= \min \left\{ \mathcal{U}_n, \mu + c_\alpha \left( \widehat{\Sigma}_{Y,n} \right) \sqrt{\widehat{\Sigma}_Y \left( \hat{\theta}_n \right)} \right\}.\end{aligned}$$

The proof of Proposition 8 shows that  $F_{TN} \left( Y_n \left( \hat{\theta}_n \right); \mu, \widehat{\Sigma}_{Y,n} \left( \hat{\theta}_n \right), \mathcal{L}_n^H(\mu), \mathcal{U}_n^H(\mu) \right)$  is strictly decreasing in  $\mu$ , so for a given value  $\mu_{Y,0}$ ,

$$\hat{\mu}_{\alpha,n}^H \geq \mu_{Y,0} \iff F_{TN} \left( Y_n \left( \hat{\theta}_n \right); \mu_{Y,0}, \widehat{\Sigma}_{Y,n} \left( \hat{\theta}_n \right), \mathcal{L}_n^H(\mu_{Y,0}), \mathcal{U}_n^H(\mu_{Y,0}) \right) \geq 1 - \alpha.$$

As in the proof of Proposition 9

$$\begin{aligned}F_{TN} \left( Y_n \left( \hat{\theta}_n \right); \mu_{Y,n} \left( \hat{\theta}_n; P_n \right), \widehat{\Sigma}_{Y,n} \left( \hat{\theta}_n \right), \mathcal{L}_n^H \left( \mu_{Y,n} \left( \hat{\theta}_n; P_n \right) \right), \mathcal{U}_n^H \left( \mu_{Y,n} \left( \hat{\theta}_n; P_n \right) \right) \right) \\ = F_{TN} \left( Y_n^* \left( \hat{\theta}_n \right); 0, \widehat{\Sigma}_{Y,n} \left( \hat{\theta}_n \right), \mathcal{L}_n^{H*}, \mathcal{U}_n^{H*} \right),\end{aligned}$$

where  $\mathcal{L}_n^{H*} = \max \left\{ \mathcal{L}_n^*, -c_\alpha \left( \widehat{\Sigma}_{Y,n} \right) \sqrt{\widehat{\Sigma}_Y \left( \hat{\theta}_n \right)} \right\}$  and  $\mathcal{U}_n^{H*} = \min \left\{ \mathcal{U}_n^*, c_\alpha \left( \widehat{\Sigma}_{Y,n} \right) \sqrt{\widehat{\Sigma}_Y \left( \hat{\theta}_n \right)} \right\}$  so  $\hat{\mu}_{\alpha,n}^H \geq \mu_{Y,n} \left( \hat{\theta}_n; P \right)$  if and only if

$$F_{TN} \left( Y_n^* \left( \hat{\theta}_n \right); 0, \widehat{\Sigma}_{Y,n} \left( \hat{\theta}_n \right), \mathcal{L}_n^{H*}, \mathcal{U}_n^{H*} \right) \geq 1 - \alpha.$$

Lemma 8 implies that

$$\left( Y_{n_s}^*, \widehat{\Sigma}_{Y,n_s}, \mathcal{L}_{n_s}^{H*}, \mathcal{U}_{n_s}^{H*}, \hat{\theta}_{n_s} \right) \rightarrow_d \left( Y^*, \Sigma_Y^*, \mathcal{L}^{H*}, \mathcal{U}^{H*}, \hat{\theta} \right),$$

where  $\mathcal{L}^{H*}$  and  $\mathcal{U}^{H*}$  are equal to  $\mathcal{L}_n^{H*}$  and  $\mathcal{U}_n^{H*}$  after replacing  $(X_n, Y_n, \widehat{\Sigma}_n)$  with  $(X, Y, \Sigma^*)$ . Then by the continuous mapping theorem and (57),

$$\begin{aligned}\left( F_{TN} \left( Y_{n_s}^* \left( \hat{\theta}_{n_s} \right); 0, \widehat{\Sigma}_{Y,n_s} \left( \hat{\theta}_{n_s} \right), \mathcal{L}_{n_s}^{H*}, \mathcal{U}_{n_s}^{H*} \right), 1 \left\{ \hat{\theta}_{n_s} = \tilde{\theta}, \mu_{Y,n_s} \left( \hat{\theta}_{n_s}; P_{n_s} \right) \in CS_{P,n_s}^\beta \right\} \right) \\ \rightarrow_d \left( F_{TN} \left( Y^* \left( \hat{\theta} \right); 0, \Sigma_Y^* \left( \hat{\theta} \right), \mathcal{L}^{H*}, \mathcal{U}^{H*} \right), 1 \left\{ \hat{\theta} = \tilde{\theta}, Y^* \left( \hat{\theta} \right) \in \left[ -c_\alpha \left( \Sigma_Y^* \right) \sqrt{\Sigma_Y^* \left( \hat{\theta} \right)}, c_\alpha \left( \Sigma_Y^* \right) \sqrt{\Sigma_Y^* \left( \hat{\theta} \right)} \right] \right\} \right).\end{aligned}$$

Hence, by the same argument as in the proof of Proposition 9,

$$\lim_{s \rightarrow \infty} Pr_{P_{n_s}} \left\{ \mu_{Y,n_s} \left( \hat{\theta}_{n_s}; P_{n_s} \right) \in CS_{U,-,n_s}^H \mid \hat{\theta}_{n_s} = \tilde{\theta}, \mu_{Y,n_s} \left( \hat{\theta}_{n_s}; P_{n_s} \right) \in CS_{P,n_s}^\beta \right\} = \alpha,$$

as we aimed to show.

To prove (37), note that for  $\widetilde{CS}_{U,+}^H = (\hat{\mu}_{\alpha,n}^H, \infty)$ ,

$$\hat{\mu}_{\alpha,n}^H \geq \mu_{Y,n}(\hat{\theta}_n; P) \iff \mu_{Y,n}(\hat{\theta}_n; P) \notin \widetilde{CS}_{U,+}^H$$

and thus that the argument above proves that

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in \widetilde{CS}_{U,+}^H \mid C_n^H(\tilde{\theta}; P) \right\} - (1-\alpha) \right| Pr_P \left\{ C_n^H(\tilde{\theta}; P) \right\} = 0$$

for  $C_n^H(\tilde{\theta}; P)$  as in the statement of the proposition. Since

$$\sum_{\tilde{\theta} \in \Theta} Pr_P \left\{ \hat{\theta}_{n_s} = \tilde{\theta}, \mu_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{P,n_s}^\beta \right\} = Pr_P \left\{ \mu_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{P,n_s}^\beta \right\} + o(1), \quad (58)$$

and Proposition 11 shows that

$$\liminf_{s \rightarrow \infty} \inf_{P \in \mathcal{P}_{n_s}} Pr_P \left\{ \mu_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{P,n_s}^\beta \right\} \geq 1 - \beta,$$

Lemma 6 together with (36) implies that

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} Pr_P \left\{ \hat{\mu}_{\alpha,n}^H < \mu_{Y,n}(\hat{\theta}_n; P) \right\} \geq (1-\alpha)(1-\beta) = (1-\alpha) - \beta(1-\alpha)$$

and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \left\{ \hat{\mu}_{\alpha,n}^H < \mu_{Y,n}(\hat{\theta}_n; P) \right\} \leq 1 - \alpha(1-\beta) = (1-\alpha) + \beta\alpha$$

from which the second result of the proposition follows immediately.  $\square$

**Proof of Corollary 2** Note that by construction

$$CS_{ET,n}^H = \left[ \hat{\mu}_{\frac{\alpha-\beta}{2(1-\beta)},n}^H, \hat{\mu}_{1-\frac{\alpha-\beta}{2(1-\beta)},n}^H \right],$$

where  $\hat{\mu}_{\frac{\alpha-\beta}{2(1-\beta)},n}^H < \hat{\mu}_{1-\frac{\alpha-\beta}{2(1-\beta)},n}^H$  provided  $\frac{\alpha-\beta}{1-\beta} < 1$ . Hence,

$$\begin{aligned} & Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n}^H \mid C_n^H(\tilde{\theta}; P) \right\} \\ &= Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \leq \hat{\mu}_{1-\frac{\alpha-\beta}{2(1-\beta)},n}^H \mid C_n^H(\tilde{\theta}; P) \right\} - Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) < \hat{\mu}_{\frac{\alpha-\beta}{2(1-\beta)},n}^H \mid C_n^H(\tilde{\theta}; P) \right\}, \end{aligned}$$

so Proposition 12 immediately implies (38).

Equation (58) in the proof of Proposition 12 together with Lemma 6 implies that

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n}^H \right\} \geq \frac{1-\alpha}{1-\beta}(1-\beta) = 1-\alpha$$

so (39) holds. We could likewise get an upper bound on coverage using Lemma 6, but obtain a sharper bound by proving the result directly. Specifically, note that

$$\mu_{Y,n}(\hat{\theta}_n; P_n) \in CS_{ET,n}^H \Rightarrow \mu_{Y,n}(\hat{\theta}_n; P_n) \in CS_{P,n}^\beta.$$

Hence,

$$\begin{aligned} & Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n}^H \right\} \\ = & Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n}^H \mid \mu_{Y,n}(\hat{\theta}_n; P_n) \in CS_{P,n}^\beta \right\} Pr \left\{ \mu_{Y,n}(\hat{\theta}_n; P_n) \in CS_{P,n}^\beta \right\}. \end{aligned}$$

By the first part of the proposition, this implies that

$$\begin{aligned} \limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n}^H \right\} & \leq \frac{1-\alpha}{1-\beta} \limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr \left\{ \mu_{Y,n}(\hat{\theta}_n; P_n) \in CS_{P,n}^\beta \right\} \\ & \leq \frac{1-\alpha}{1-\beta}, \end{aligned}$$

so (40) holds as well.  $\square$

**Proof of Proposition 13** The first part of the result follows by the same argument as in the proof of Proposition 10, where as in the proof of Proposition 12 we use the conditioning event  $\left\{ \hat{\theta}_n = \tilde{\theta}, \mu_{Y,n}(\hat{\theta}_n; P_n) \in CS_{P,n}^\beta \right\}$  and replace  $(\mathcal{L}_n, \mathcal{U}_n)$  by  $(\mathcal{L}_n^H, \mathcal{U}_n^H)$ . The second part of the result follows by the same argument as in the proof of Corollary 2.  $\square$

## D.2 Asymptotic Validity of Norm-Maximization

We next turn to the asymptotic validity of our results in norm-maximization settings. As discussed in the main text and Appendix B.2, the norm-maximization problem arises when we follow Elliott and Müller (2007, 2014) and Wang (2018) and model the degree of parameter instability as shrinking with the sample size. If we instead take the degree of parameter instability to be fixed, one can show that the threshold regression and structural break models reduce to level maximization asymptotically.

The issue here is similar to the difference in the asymptotic distribution of the Vuong

(1989) test between the nested and non-nested cases. As this analogy suggests, it may be possible to develop asymptotic results for threshold regression and structural break models that, analogous to the results of Shi (2015) and Schennach and Wilhelm (2017) for the Vuong test, cover cases with both fixed and local parameter instability. We are unaware of such results for existing procedures in threshold regression and structural break literatures, however, and this point is far afield from our primary focus in this project. Hence, in this section we follow Elliott and Müller (2007, 2014) and Wang (2018) and limit attention to cases with local parameter instability and, refer readers interested in fixed parameter instability to the level-maximization results discussed above.

Section D.2.1 states the bounded asymptotic means assumption. Section D.2.2 then states our uniformity results for norm-maximization settings. Section D.2.3 collects additional technical lemmas for this setting. Finally, Sections D.2.4 and D.2.5 collect proofs for the lemmas and the uniformity results, respectively.

### D.2.1 Assumptions

To prove uniform asymptotic validity for norm maximization, we will continue to impose Assumptions 2-4 of the last section. To limit attention to the case with local parameter instability, we further impose the following assumption.

#### Assumption 5

*There exists a finite constant  $C > 0$  such that*

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} (\|\mu_{X,n}(P)\| + \|\mu_{Y,n}(P)\|) \leq C.$$

This assumption requires that  $\|\mu_{X,n}(P)\|$  and  $\|\mu_{Y,n}(P)\|$  be uniformly bounded over  $\mathcal{P}_n$  by a constant that does not depend on the sample size. Given the scaling of  $(X_n, Y_n)$  in our threshold regression and structural break examples, this corresponds to the case with local parameter instability. It may be possible to relax this assumption, but it holds in all settings we have encountered that give rise to the norm-maximization problem asymptotically. Specifically, note that Assumption 5 holds if we take  $\mathcal{P}_n$  to correspond to any finite collection of local sequences of the sort studied by Elliott and Müller (2007, 2014) and Wang (2018). If we instead consider nonlocal sequences, then as discussed above we instead obtain a level-maximization problem asymptotically.

### D.2.2 Norm Maximization Uniformity Results

For  $\hat{\theta}_n = \operatorname{argmax}_{\theta} \|X_n(\theta)\|$  we obtain the following results.

**Proposition 14**

Under Assumptions 2-5, for  $\hat{\theta}_n = \arg \max_{\theta} \|X_n(\theta)\|$  and  $\hat{\mu}_{\alpha,n}$  the  $\alpha$ -quantile unbiased estimator,

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \hat{\mu}_{\alpha,n} \geq \mu_{Y,n}(\hat{\theta}_n; P) \mid \hat{\theta}_n = \tilde{\theta} \right\} - \alpha \right| Pr_P \left\{ \hat{\theta}_n = \tilde{\theta} \right\} = 0, \quad (59)$$

for all  $\tilde{\theta} \in \Theta$ , and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \hat{\mu}_{\alpha,n} \geq \mu_{Y,n}(\hat{\theta}_n; P) \right\} - \alpha \right| = 0. \quad (60)$$

**Corollary 3**

Under Assumptions 2-5, for  $\hat{\theta}_n = \arg \max_{\theta} \|X_n(\theta)\|$  and  $CS_{ET,n}$  the level  $1 - \alpha$  equal-tailed confidence set,

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n} \mid \hat{\theta}_n = \tilde{\theta} \right\} - (1 - \alpha) \right| Pr_P \left\{ \hat{\theta}_n = \tilde{\theta} \right\} = 0,$$

for all  $\tilde{\theta} \in \Theta$ , and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n} \right\} - (1 - \alpha) \right| = 0.$$

**Proposition 15**

Under Assumptions 2-5, for  $\hat{\theta}_n = \arg \max_{\theta} \|X_n(\theta)\|$  and  $CS_{U,n}$  the level  $1 - \alpha$  unbiased confidence set,

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n} \mid \hat{\theta}_n = \tilde{\theta} \right\} - (1 - \alpha) \right| Pr_P \left\{ \hat{\theta}_n = \tilde{\theta} \right\} = 0, \quad (61)$$

for all  $\tilde{\theta} \in \Theta$ , and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n} \right\} - (1 - \alpha) \right| = 0. \quad (62)$$

**Proposition 16**

Under Assumptions 2-5, for  $\hat{\theta}_n = \arg \max_{\theta} \|X_n(\theta)\|$  and  $CS_{P,n}$  the level  $1 - \alpha$  projection confidence set,

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{P,n} \right\} \geq 1 - \alpha.$$

**Proposition 17**

Under Assumptions 2-5, for  $\hat{\theta}_n = \arg \max_{\theta} \|X_n(\theta)\|$ ,  $\hat{\mu}_{\alpha,n}^H$  the  $\alpha$ -quantile unbiased hybrid

estimator based on initial confidence set  $CS_{P,n}^\beta$ , and

$$C_n^H(\tilde{\theta}; P) = 1 \left\{ \hat{\theta}_n = \tilde{\theta}, \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{P,n}^\beta \right\},$$

we have

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \hat{\mu}_{\alpha,n}^H \geq \mu_{Y,n}(\hat{\theta}_n; P) \mid C_n^H(\tilde{\theta}; P) = 1 \right\} - \alpha \mid E_P \left\{ C_n^H(\tilde{\theta}; P) \right\} \right| = 0,$$

for all  $\tilde{\theta} \in \Theta$ . Moreover

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \hat{\mu}_{\alpha,n}^H \geq \mu_{Y,n}(\hat{\theta}_n; P) \right\} - \alpha \right| \leq \max\{\alpha, 1 - \alpha\} \beta.$$

#### Corollary 4

Under Assumptions 2-5, for  $\hat{\theta}_n = \operatorname{argmax}_\theta \|X_n(\theta)\|$  and  $CS_{ET,n}^H$  the level  $1 - \alpha$  equal-tailed hybrid confidence set based on initial confidence set  $CS_{P,n}^\beta$ ,

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n}^H \mid C_n^H(\tilde{\theta}; P) = 1 \right\} - \frac{1 - \alpha}{1 - \beta} \mid E_P \left\{ C_n^H(\tilde{\theta}; P) \right\} \right| = 0,$$

for all  $\tilde{\theta} \in \Theta$ ,

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n}^H \right\} \geq 1 - \alpha,$$

and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{ET,n}^H \right\} \leq \frac{1 - \alpha}{1 - \beta} \leq 1 - \alpha + \beta.$$

#### Proposition 18

Under Assumptions 2-5, for  $\hat{\theta}_n = \operatorname{argmax}_\theta \|X_n(\theta)\|$  and  $CS_{U,n}^H$  the level  $1 - \alpha$  unbiased hybrid confidence set based on initial confidence set  $CS_{P,n}^\beta$ ,

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n}^H \mid C_n^H(\tilde{\theta}; P) = 1 \right\} - \frac{1 - \alpha}{1 - \beta} \mid E_P \left\{ C_n^H(\tilde{\theta}; P) \right\} \right| = 0,$$

for all  $\tilde{\theta} \in \Theta$ ,

$$\liminf_{n \rightarrow \infty} \inf_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n}^H \right\} \geq 1 - \alpha,$$

and

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_{U,n}^H \right\} \leq \frac{1 - \alpha}{1 - \beta} \leq 1 - \alpha + \beta.$$

### D.2.3 Auxiliary Lemmas

To prove uniformity in norm-maximization settings, we rely on some of the lemmas in Section D.1.3 along with a few additional results.

#### Lemma 11

Under Assumptions 3 and 5, for any sequence of confidence sets  $CS_n$ , any sequence of sets  $\mathcal{C}_n(P)$  indexed by  $P$ ,  $C_n(P) = 1 \left\{ \left( X_n, Y_n, \widehat{\Sigma}_n \right) \in \mathcal{C}_n(P) \right\}$ , and any constant  $\alpha$ , to show that

$$\limsup_{n \rightarrow \infty} \sup_{P \in \mathcal{P}_n} \left| \Pr_P \left\{ \mu_{Y,n}(\hat{\theta}_n; P) \in CS_n \mid C_n(P) = 1 \right\} - \alpha \mid \Pr_P \{ C_n(P) = 1 \} \right| = 0$$

it suffices to show that for all subsequences  $\{n_s\} \subseteq \{n\}$ ,  $\{P_{n_s}\} \in \mathcal{P}^\infty = \times_{n=1}^\infty \mathcal{P}_n$  with:

1.  $\Sigma(P_{n_s}) \rightarrow \Sigma^* \in \mathcal{S}$  for  $\mathcal{S}$  as defined in (41)
2.  $(\mu_{X,n_s}(P_{n_s}), \mu_{Y,n_s}(P_{n_s})) \rightarrow (\mu_X^*, \mu_Y^*)$  for  $(\mu_X^*, \mu_Y^*)$  finite

we have

$$\lim_{s \rightarrow \infty} \Pr_{P_{n_s}} \left\{ \hat{\mu}_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{n_s} \mid C_{n_s}(P_{n_s}) = 1 \right\} = \alpha.$$

To state the next result, for  $Z_{\tilde{\theta},n,j}$  the  $j$ th element of  $Z_{\tilde{\theta},n}$  as defined in Lemma 7, let us define

$$\begin{aligned} A_n(\tilde{\theta}, \theta) &= \widehat{\Sigma}_{Y,n}(\tilde{\theta})^{-2} \sum_{j=1}^{d_X} \left[ \widehat{\Sigma}_{XY,n,j}(\tilde{\theta})^2 - \widehat{\Sigma}_{XY,n,j}(\theta, \tilde{\theta})^2 \right] \\ B_{Z,n}(\tilde{\theta}, \theta) &= 2\widehat{\Sigma}_{Y,n}(\tilde{\theta})^{-2} \sum_{j=1}^{d_X} \left[ \widehat{\Sigma}_{XY,n,j}(\tilde{\theta}) Z_{\tilde{\theta},n,j}(\tilde{\theta}) - \widehat{\Sigma}_{XY,n,j}(\theta, \tilde{\theta}) Z_{\tilde{\theta},n,j}(\theta) \right] \\ C_{Z,n}(\tilde{\theta}, \theta) &= \sum_{j=1}^{d_X} \left[ Z_{\tilde{\theta},n,j}(\tilde{\theta})^2 - Z_{\tilde{\theta},n,j}(\theta)^2 \right], \\ D_{Z,n}(\tilde{\theta}, \theta) &= B_{Z,n}(\tilde{\theta}, \theta)^2 - 4A_n(\tilde{\theta}, \theta)C_{Z,n}(\tilde{\theta}, \theta), \\ G_{Z,n}(\tilde{\theta}, \theta) &= \frac{-B_{Z,n}(\tilde{\theta}, \theta) - \sqrt{D_{Z,n}(\tilde{\theta}, \theta)}}{2A_n(\tilde{\theta}, \theta)}, K_{Z,n}(\tilde{\theta}, \theta) = \frac{-B_{Z,n}(\tilde{\theta}, \theta) + \sqrt{D_{Z,n}(\tilde{\theta}, \theta)}}{2A_n(\tilde{\theta}, \theta)} \end{aligned}$$

and

$$H_{Z,n}(\tilde{\theta}, \theta) = -\frac{C_{Z,n}(\tilde{\theta}, \theta)}{B_{Z,n}(\tilde{\theta}, \theta)}.$$

Based on these objects, let us further define

$$\begin{aligned}\ell_{Z,n}^1(\tilde{\theta}) &= \max \left\{ \max_{\theta \in \Theta: A_n(\tilde{\theta}, \theta) < 0, D_{Z,n}(\tilde{\theta}, \theta) \geq 0} G_{Z,n}(\tilde{\theta}, \theta), \max_{\theta \in \Theta: A_n(\tilde{\theta}, \theta) = 0, B_{Z,n}(\tilde{\theta}, \theta) > 0} H_{Z,n}(\tilde{\theta}, \theta) \right\} \\ \ell_{Z,n}^2(\tilde{\theta}, \theta) &= \max \left\{ \max_{\theta \in \Theta: A_n(\tilde{\theta}, \theta) < 0, D_{Z,n}(\tilde{\theta}, \theta) \geq 0} G_{Z,n}(\tilde{\theta}, \theta), \max_{\theta \in \Theta: A_n(\tilde{\theta}, \theta) = 0, B_{Z,n}(\tilde{\theta}, \theta) > 0} H_{Z,n}(\tilde{\theta}, \theta), G_{Z,n}(\tilde{\theta}, \theta) \right\} \\ u_{Z,n}^1(\tilde{\theta}, \theta) &= \min \left\{ \min_{\theta \in \Theta: A_n(\tilde{\theta}, \theta) < 0, D_{Z,n}(\tilde{\theta}, \theta) \geq 0} K_{Z,n}(\tilde{\theta}, \theta), \min_{\theta \in \Theta: A_n(\tilde{\theta}, \theta) = 0, B_{Z,n}(\tilde{\theta}, \theta) < 0} H_{Z,n}(\tilde{\theta}, \theta), K_{Z,n}(\tilde{\theta}, \theta) \right\} \\ u_{Z,n}^2(\tilde{\theta}) &= \min \left\{ \min_{\theta \in \Theta: A_n(\tilde{\theta}, \theta) < 0, D_{Z,n}(\tilde{\theta}, \theta) \geq 0} K_{Z,n}(\tilde{\theta}, \theta), \min_{\theta \in \Theta: A_n(\tilde{\theta}, \theta) = 0, B_{Z,n}(\tilde{\theta}, \theta) < 0} H_{Z,n}(\tilde{\theta}, \theta) \right\}.\end{aligned}$$

**Lemma 12**

Under Assumptions 2 and 4, for any  $\{n_s\}$  and  $\{P_{n_s}\}$  satisfying conditions (1) and (2) of Lemma 11,

$$\begin{aligned}& \left( Y_{n_s}, \hat{\Sigma}_{n_s}, \hat{\theta}_{n_s}, \ell_{Z,n_s}^1(\tilde{\theta}), \ell_{Z,n_s}^2(\tilde{\theta}, \theta), u_{Z,n_s}^1(\tilde{\theta}, \theta), u_{Z,n_s}^2(\tilde{\theta}) \right) \\ & \rightarrow_d \left( Y^*, \Sigma^*, \hat{\theta}, \ell_Z^1(\tilde{\theta}), \ell_Z^2(\tilde{\theta}, \theta), u_Z^1(\tilde{\theta}, \theta), u_Z^2(\tilde{\theta}) \right),\end{aligned}$$

where the objects on the right hand side are calculated based on  $(X^*, Y^*, \Sigma^*)$  for

$$\begin{pmatrix} X^* \\ Y^* \end{pmatrix} \sim N(\mu^*, \Sigma^*).$$

To state our next two lemmas, we consider sets that can be written as finite unions of disjoint intervals,  $\mathcal{Y}^K = \cup_{k=1}^K [\ell^k, u^k]$ .

**Lemma 13**

For  $F_{TN}(\cdot; \mu, \Sigma_Y(\theta), \mathcal{Y}^K)$  the distribution function for  $\zeta$  with

$$\zeta \sim \xi | \xi \in \mathcal{Y}^K, \xi \sim N(\mu, \Sigma_Y(\theta)),$$

$F_{TN}(Y(\theta); \mu, \Sigma_Y(\theta), \mathcal{Y}^K)$  is continuous on the set

$$\left\{ \begin{array}{l} (Y(\theta), \mu, \Sigma_Y(\theta)) \in \mathbb{R}^3, \ell^1 \in [-\infty, \infty), \\ \{\ell^k\}_{k=2}^K \in \mathbb{R}, \{u^k\}_{k=1}^{K-1} \in \mathbb{R}, u^K \in (-\infty, \infty) \end{array} : \Sigma_Y(\theta) > 0, \sum_k |u^k - \ell^k| > 0, u^k \geq \ell^k \geq u^{k-1} \text{ for all } k \right\}.$$

To state the next lemma, let

$$(c_l(\mu, \Sigma_Y(\theta), \mathcal{Y}^K), c_u(\mu, \Sigma_Y(\theta), \mathcal{Y}^K)) \quad (63)$$

solve

$$Pr\{\zeta \in [c_l, c_u]\} = 1 - \alpha$$

$$E[\zeta 1\{\zeta \in [c_l, c_u]\}] = (1 - \alpha)E[\zeta]$$

for  $\zeta$  as in Lemma 13.

**Lemma 14**

The function (63) is continuous in  $(\mu, \Sigma_Y(\theta), \mathcal{Y}^K)$  for Lebesgue almost-every  $\{\ell^k, u^k\}_{k=1}^K$  on the set

$$\left\{ \begin{array}{l} (\mu, \Sigma_Y(\theta)) \in \mathbb{R}^2, \ell^1 \in [-\infty, \infty), \\ \{\ell^k\}_{k=2}^K \in \mathbb{R}, \{u^k\}_{k=1}^{K-1} \in \mathbb{R}, u^K \in (-\infty, \infty] : \Sigma_Y(\theta) > 0, \sum_k |u^k - \ell^k| > 0, u^k \geq \ell^k \geq u^{k-1} \text{ for all } k \end{array} \right\}.$$

Moreover, if we fix any  $(\mu, \Sigma_Y(\theta))$  in this set, and fix all but one element of  $\{\ell^k, u^k\}_{k=1}^K$ , (63) is almost-everywhere continuous in the remaining element.

**D.2.4 Proofs of Auxiliary Lemmas**

**Proof of Lemma 11** Follows by the same argument as in the proof of Lemma 5.

**Proof of Lemma 12** Note that Assumption 4 along with condition (2) of Lemma 11 imply that

$$\begin{pmatrix} X_{n_s} \\ Y_{n_s} \end{pmatrix} \rightarrow_d \begin{pmatrix} X^* \\ Y^* \end{pmatrix} \sim N(\mu^*, \Sigma^*),$$

while Assumption 2 implies that  $\widehat{\Sigma}_{n_s} \rightarrow_p \Sigma^*$ .

If we define

$$(A^*(\tilde{\theta}, \theta), B_Z^*(\tilde{\theta}, \theta), C_Z^*(\tilde{\theta}, \theta), D_Z^*(\tilde{\theta}, \theta), G_Z^*(\tilde{\theta}, \theta), K_Z^*(\tilde{\theta}, \theta), H_Z^*(\tilde{\theta}, \theta))$$

as the analog of

$$(A_n(\tilde{\theta}, \theta), B_{Z,n}(\tilde{\theta}, \theta), C_{Z,n}(\tilde{\theta}, \theta), D_{Z,n}(\tilde{\theta}, \theta), G_{Z,n}(\tilde{\theta}, \theta), K_{Z,n}(\tilde{\theta}, \theta), H_{Z,n}(\tilde{\theta}, \theta))$$

based on  $(X^*, Y^*, \Sigma^*)$ , the continuous mapping theorem implies that

$$(A_{n_s}(\tilde{\theta}, \theta), B_{Z,n_s}(\tilde{\theta}, \theta), C_{Z,n_s}(\tilde{\theta}, \theta)) \rightarrow_d (A^*(\tilde{\theta}, \theta), B_Z^*(\tilde{\theta}, \theta), C_Z^*(\tilde{\theta}, \theta))$$

where this convergence holds jointly over all  $(\theta, \tilde{\theta}) \in \Theta^2$ . If  $A^*(\tilde{\theta}, \theta) \neq 0$ , another application of the continuous mapping theorem implies that<sup>30</sup>

$$\left( D_{Z, n_s}(\tilde{\theta}, \theta), G_{Z, n_s}(\tilde{\theta}, \theta), K_{Z, n_s}(\tilde{\theta}, \theta) \right) \rightarrow_d \left( D_Z^*(\tilde{\theta}, \theta), G_Z^*(\tilde{\theta}, \theta), K_Z^*(\tilde{\theta}, \theta) \right).$$

If instead  $A^*(\tilde{\theta}, \theta) = 0$ , note that

$$Z_{\tilde{\theta}, j}^*(\theta) = X_j^*(\theta) - \frac{\Sigma_{XY, j}^*(\theta, \tilde{\theta})}{\Sigma_Y^*(\tilde{\theta})} Y^*(\tilde{\theta}) = X_j^*(\theta) - \frac{\Sigma_{XY, j}^*(\tilde{\theta})}{\Sigma_Y^*(\tilde{\theta})} Y^*(\tilde{\theta}).$$

Hence, in this setting

$$B_Z^*(\tilde{\theta}, \theta) = 2\Sigma_Y^*(\tilde{\theta})^{-2} \sum_{j=1}^{d_X} [X_j^*(\tilde{\theta}) - X_j^*(\theta)]$$

and condition (1) of Lemma 11 implies that  $Pr\{B_Z^*(\tilde{\theta}, \theta) = 0\} = 0$  for all  $\theta \neq \tilde{\theta}$ . Hence,  $Pr\{D_Z^*(\tilde{\theta}, \theta) > 0\} = 1$ . Moreover, note that for  $b \neq 0$  and all  $c$

$$\lim_{a \rightarrow 0} \frac{-b - \sqrt{b^2 - 4ac}}{2a} = \begin{cases} -\frac{c}{b} & \text{if } b < 0 \\ -\infty & \text{if } b > 0 \end{cases},$$

while

$$\lim_{a \rightarrow 0} \frac{-b + \sqrt{b^2 - 4ac}}{2a} = \begin{cases} \infty & \text{if } b < 0 \\ -\frac{c}{b} & \text{if } b > 0 \end{cases}.$$

Hence, if  $A^*(\theta, \tilde{\theta}) = 0$ ,

$$\frac{-B_{Z, n}(\tilde{\theta}, \theta) - \sqrt{D_{Z, n}(\tilde{\theta}, \theta)}}{2A_n(\tilde{\theta}, \theta)} \rightarrow_d -\infty \cdot 1\{B_Z^*(\tilde{\theta}, \theta) > 0\} + H_Z^*(\tilde{\theta}, \theta)$$

---

<sup>30</sup>Note that we allow the possibility that  $(D_{Z, n}(\tilde{\theta}, \theta), D_Z^*(\tilde{\theta}, \theta))$  may be negative, so  $(G_{Z, n}(\tilde{\theta}, \theta), K_{Z, n}(\tilde{\theta}, \theta))$  and  $(G_Z^*(\tilde{\theta}, \theta), K_Z^*(\tilde{\theta}, \theta))$  may be complex-valued.

and

$$\frac{-B_{Z,n}(\tilde{\theta},\theta) + \sqrt{D_{Z,n}(\tilde{\theta},\theta)}}{2A_n(\tilde{\theta},\theta)} \rightarrow_d \infty \cdot 1\{B_Z^*(\tilde{\theta},\theta) < 0\} + H_Z^*(\tilde{\theta},\theta),$$

with the convention that  $\infty \cdot 0 = 0$ . Finally, another application of the continuous mapping theorem shows that when  $A^*(\tilde{\theta},\theta) = 0$ ,

$$H_{Z,n_s}(\tilde{\theta},\theta) \rightarrow_d H_Z^*(\tilde{\theta},\theta).$$

Since all of these convergence results hold jointly over  $(\theta, \tilde{\theta}) \in \Theta^2$ , another application of the continuous mapping theorem implies that

$$\left(\ell_{Z,n_s}^1(\tilde{\theta}), \ell_{Z,n_s}^2(\tilde{\theta},\theta), u_{Z,n_s}^1(\tilde{\theta},\theta), u_{Z,n_s}^2(\tilde{\theta},\theta)\right) \rightarrow_d \left(\ell_Z^{1*}(\tilde{\theta}), \ell_Z^{2*}(\tilde{\theta},\theta), u_Z^{1*}(\tilde{\theta},\theta), u_Z^{2*}(\tilde{\theta},\theta)\right).$$

Moreover,  $\hat{\theta}$  is almost everywhere continuous in  $X^*$ , so that  $(Y_{n_s}, \hat{\Sigma}_{n_s}, \hat{\theta}_{n_s}) \rightarrow_d (Y^*, \Sigma^*, \hat{\theta})$ , where this convergence occurs jointly with that above. Thus, we have established the desired result.  $\square$

**Proof of Lemma 13** Note that we can write

$$F_{TN}(Y(\theta); \mu, \Sigma_Y(\theta), \mathcal{Y}^K) = \frac{\sum_k 1\{Y(\theta) \geq \ell^k\} \left( F_N\left(\frac{u^k \wedge Y(\theta) - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\ell^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}{\sum_k \left( F_N\left(\frac{u^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\ell^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}.$$

Hence, we trivially obtain continuity for  $\Sigma_Y(\theta) > 0, Y(\theta) \in \mathbb{R}, \mu \in \mathbb{R}, 0 < \sum_k |u^k - \ell^k| < \infty$ . Moreover, as in the proof of Lemma 9 we retain continuity as we allow  $\ell^1 \rightarrow -\infty$  and/or  $u^K \rightarrow \infty$ , in the sense that for a sequence of sets  $\mathcal{Y}_m^K$  with

$$\{\ell_m^k, u_m^k\}_{k=1}^K \rightarrow \{\ell_\infty^k, u_\infty^k\}_{k=1}^K$$

with  $\ell_\infty^1 = -\infty$  and/or  $u_\infty^K = \infty$  and the other elements finite,

$$F_{TN}(Y(\theta); \mu, \Sigma_Y(\theta), \mathcal{Y}_m^K) \rightarrow F_{TN}(Y(\theta); \mu, \Sigma_Y(\theta), \mathcal{Y}_\infty^K).$$

$\square$

**Proof of Lemma 14** Note that

$$Pr\{\zeta \in [c_l, c_u]\} = \frac{\sum_k 1\{u^k \geq c_l, c_u \geq \ell^k\} \left( F_N\left(\frac{u^k \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\ell^k \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}{\sum_k \left( F_N\left(\frac{u^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\ell^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}$$

while

$$E[\zeta 1\{\zeta \in [c_l, c_u]\}] = E[\zeta | \zeta \in [c_l, c_u]] Pr\{\zeta \in [c_l, c_u]\}$$

where

$$E[\zeta | \zeta \in [c_l, c_u]] = \mu + \sqrt{\Sigma_Y(\theta)} \frac{\sum_k 1\{u^k \geq c_l, c_u \geq \ell^k\} \left( f_N\left(\frac{\ell^k \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - f_N\left(\frac{u^k \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}{\sum_k 1\{u^k \geq c_l, c_u \geq \ell^k\} \left( F_N\left(\frac{u^k \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\ell^k \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}.$$

Thus,

$$\begin{aligned} E[\zeta 1\{\zeta \in [c_l, c_u]\}] &= \mu \frac{\sum_k 1\{u^k \geq c_l, c_u \geq \ell^k\} \left( F_N\left(\frac{u^k \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\ell^k \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}{\sum_k \left( F_N\left(\frac{u^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\ell^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)} \\ &\quad + \sqrt{\Sigma_Y(\theta)} \frac{\sum_k 1\{u^k \geq c_l, c_u \geq \ell^k\} \left( f_N\left(\frac{\ell^k \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - f_N\left(\frac{u^k \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}{\sum_k \left( F_N\left(\frac{u^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\ell^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)} \end{aligned}$$

and

$$E[\zeta] = \mu + \sqrt{\Sigma_Y(\theta)} \frac{\sum_k \left( f_N\left(\frac{\ell^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - f_N\left(\frac{u^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}{\sum_k \left( F_N\left(\frac{u^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) - F_N\left(\frac{\ell^k - \mu}{\sqrt{\Sigma_Y(\theta)}}\right) \right)}.$$

Using analogous reasoning to that in the proof of Lemma 10, we can write (63) as the solution to

$$g(c; \mu, \sqrt{\Sigma_Y(\theta)}, \mathcal{Y}^K) = 0 \tag{64}$$

for

$$g(c; \mu, \sqrt{\Sigma_Y(\theta)}, \mathcal{Y}^K) =$$

$$\left( \begin{array}{l} \sum_k 1\{u^k \geq c_l, c_u \geq \ell^k\} \left( F_N \left( \frac{u^k \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - F_N \left( \frac{\ell^k \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - (1-\alpha) \left( F_N \left( \frac{u^k - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - F_N \left( \frac{\ell^k - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) \right) \right) \\ \sum_k 1\{u^k \geq c_l, c_u \geq \ell^k\} \left( f_N \left( \frac{\ell^k \vee c_l - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - f_N \left( \frac{u^k \wedge c_u - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - (1-\alpha) \left( f_N \left( \frac{\ell^k - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) - f_N \left( \frac{u^k - \mu}{\sqrt{\Sigma_Y(\theta)}} \right) \right) \right) \end{array} \right).$$

Note that by construction

$$g\left(c; \mu, \sqrt{\Sigma_Y(\theta)}, \mathcal{Y}^K\right) = g\left(c - \mu; 0, \sqrt{\Sigma_Y(\theta)}, \mathcal{Y}^K - \mu\right),$$

which implies that

$$(c_l(\mu, \Sigma_Y(\theta), \mathcal{Y}^K), c_u(\mu, \Sigma_Y(\theta), \mathcal{Y}^K)) = (\mu + c_l(0, \Sigma_Y(\theta), \mathcal{Y}^K - \mu), \mu + c_u(0, \Sigma_Y(\theta), \mathcal{Y}^K - \mu))$$

so to prove continuity it suffices to consider the case with  $\mu = 0$ .

Next, note that  $g(c; 0, \sqrt{\Sigma_Y(\theta)}, \mathcal{Y}^K)$  is almost everywhere differentiable with respect to  $(c_l, c_u)$ , with derivative

$$\left( \begin{array}{ll} \sum_k 1\{u^k > c_l > \ell^k\} \frac{-1}{\sqrt{\Sigma_Y(\theta)}} f_N \left( \frac{c_l}{\sqrt{\Sigma_Y(\theta)}} \right) & \sum_k 1\{u^k > c_u > \ell^k\} \frac{1}{\sqrt{\Sigma_Y(\theta)}} f_N \left( \frac{c_u}{\sqrt{\Sigma_Y(\theta)}} \right) \\ \sum_k 1\{u^k > c_l > \ell^k\} \frac{-c_l}{\Sigma_Y(\theta)} f_N \left( \frac{c_l}{\sqrt{\Sigma_Y(\theta)}} \right) & \sum_k 1\{u^k > c_u > \ell^k\} \frac{c_u}{\Sigma_Y(\theta)} f_N \left( \frac{c_u}{\sqrt{\Sigma_Y(\theta)}} \right) \end{array} \right),$$

though it is non-differentiable if  $c_u \in \{u^k, \ell^k\}$  or  $c_l \in \{u^k, \ell^k\}$  for some  $k$ .

Note, however, that if we fix all but one element of  $\{\ell^k, u^k\}_{k=1}^K$  and change the remaining element, the set of values for which there exists a solution  $c$  to (64) with  $c_u \in (\ell^j, u^j)$  and  $c_l \in (\ell^k, u^k)$  for some  $j, k$  has Lebesgue measure one by arguments along the same lines as in the proof of Lemma 10. Likewise, the set of values such that there exists a solution  $c$  to (64) with  $c_l = c_u$  has Lebesgue measure zero as well. The implicit function theorem thus implies that (63) is almost-everywhere continuously differentiable in the element we have selected. Since we can repeat this argument for each element of  $\{\ell^k, u^k\}_{k=1}^K$ , we obtain that (63) is continuously differentiable in  $\{\ell^k, u^k\}_{k=1}^K$  Lebesgue almost-everywhere. Moreover, as in the proof of Lemma 10 the form of (63) implies that the same remains true if we take  $\ell^1 \rightarrow -\infty$  or  $u^K \rightarrow \infty$ .

## D.2.5 Proofs of Uniformity Results

**Proof of Proposition 14** As in the proof of Proposition 9, note that

$$\hat{\mu}_{\alpha, n} \geq \mu_{Y, n}(\hat{\theta}_n; P) \iff \mu_{Y, n}(\hat{\theta}_n; P) \in CS_{U, -, n}$$

for  $CS_{U,-,n} = (-\infty, \hat{\mu}_{\alpha,n}]$ . Hence, by Lemma 11, to prove that (59) holds it suffices to show that for all  $\{n_s\}$  and  $\{P_{n_s}\}$  such that conditions (1) and (2) of the lemma hold with  $C_n = 1\{\hat{\theta}_n = \tilde{\theta}\}$ , we have

$$\lim_{s \rightarrow \infty} Pr_{P_{n_s}} \left\{ \hat{\mu}_{Y,n_s}(\hat{\theta}_{n_s}; P_{n_s}) \in CS_{U,-,n_s} | \hat{\theta}_{n_s} = \tilde{\theta} \right\} = \alpha. \quad (65)$$

To this end, note that for  $F_{TN}(Y(\theta); \mu, \Sigma_Y(\theta), \mathcal{Y}^K)$  as defined in the statement of Lemma 13, the estimator  $\hat{\mu}_{\alpha,n}$  solves

$$F_{TN}\left(Y_n(\hat{\theta}_n); \mu, \widehat{\Sigma}_{Y,n}(\hat{\theta}_n), \mathcal{Y}_n\right) = 1 - \alpha,$$

for

$$\mathcal{Y}_n = \bigcap_{\theta \in \Theta: A_n(\tilde{\theta}, \theta) > 0, D_{Z,n}(\tilde{\theta}, \theta) \geq 0} \left[ \ell_{Z,n}^1(\tilde{\theta}), u_{Z,n}^1(\tilde{\theta}, \theta) \right] \cap \left[ \ell_{Z,n}^2(\tilde{\theta}, \theta), u_{Z,n}^2(\tilde{\theta}, \theta) \right] \quad (66)$$

(see Proposition 4 in the main text). The set  $\mathcal{Y}_n$  can be written as a finite union of disjoint intervals by DeMorgan's Laws.

The cdf  $F_{TN}\left(Y_n(\hat{\theta}_n); \mu, \widehat{\Sigma}_{Y,n}(\hat{\theta}_n), \mathcal{Y}_n\right)$  is strictly decreasing in  $\mu$  as argued in the proof of Proposition 8, and is increasing in  $Y_n(\hat{\theta})$ . Hence,  $\hat{\mu}_{\alpha,n} \geq \mu_{Y,n}(\hat{\theta}_n; P)$  if and only if

$$F_{TN}\left(Y_n(\hat{\theta}_n); \mu_{Y,n}(\hat{\theta}_n; P), \widehat{\Sigma}_{Y,n}(\hat{\theta}_n), \mathcal{Y}_n\right) \geq 1 - \alpha.$$

Lemma 12 shows that  $\left(Y_n(\hat{\theta}_{n_s}), \widehat{\Sigma}_{Y,n_s}(\hat{\theta}_{n_s}), \mathcal{Y}_{n_s}, \hat{\theta}_{n_s}\right)$  converges in distribution as  $s \rightarrow \infty$ ,<sup>31</sup> so since  $F_{TN}$  is continuous by Lemma 13 while  $\operatorname{argmax}_{\theta} \|X^*(\theta)\|$  is almost everywhere continuous for  $X^*$ , the continuous mapping theorem implies that

$$\begin{aligned} & \left( F_{TN}\left(Y_{n_s}(\hat{\theta}_{n_s}); \mu_{Y,n_s}(\tilde{\theta}; P_{n_s}), \widehat{\Sigma}_{Y,n_s}(\hat{\theta}_{n_s}), \mathcal{Y}_{n_s}\right), 1\{\hat{\theta}_{n_s} = \tilde{\theta}\} \right) \\ & \rightarrow_d \left( F_{TN}\left(Y^*(\hat{\theta}); \mu_{Y,n_s}(\tilde{\theta}; P_{n_s}), \Sigma_Y^*(\hat{\theta}), \mathcal{Y}^*\right), 1\{\hat{\theta} = \tilde{\theta}\} \right), \end{aligned}$$

where  $\mathcal{Y}^*$  is the analog of  $\mathcal{Y}_n$  calculated based on  $(X^*, Y^*, \Sigma^*)$ .

Since we can write

$$Pr_{P_{n_s}} \left\{ F_{TN}\left(Y_{n_s}(\hat{\theta}_{n_s}); \mu_{Y,n_s}(\tilde{\theta}; P_{n_s}), \widehat{\Sigma}_{Y,n_s}(\hat{\theta}_{n_s}), \mathcal{Y}_{n_s}\right) \geq 1 - \alpha | \hat{\theta}_{n_s} = \tilde{\theta} \right\}$$

<sup>31</sup>Since  $\mathcal{Y}_n$  can be represented as a finite union of intervals, we use  $\mathcal{Y}_n \rightarrow_d \mathcal{Y}^*$  to denote joint convergence in distribution of (i) the number of intervals and (ii) the endpoints of the intervals.

$$= \frac{E_{P_{n_s}} \left[ 1 \left\{ F_{TN} \left( Y_{n_s} \left( \hat{\theta}_{n_s} \right); \mu_{Y, n_s} \left( \tilde{\theta}; P_{n_s} \right), \widehat{\Sigma}_{Y, n_s} \left( \hat{\theta}_{n_s} \right), \mathcal{Y}_{n_s} \right) \geq 1 - \alpha \right\} 1 \left\{ \hat{\theta}_{n_s} = \tilde{\theta} \right\} \right]}{E_{P_{n_s}} \left[ 1 \left\{ \hat{\theta}_{n_s} = \tilde{\theta} \right\} \right]},$$

and by construction

$$F_{TN} \left( Y^* \left( \hat{\theta} \right); \mu_{Y, n_s} \left( \tilde{\theta}; P_{n_s} \right), \Sigma_Y^* \left( \hat{\theta} \right), \mathcal{Y}^*, \hat{\theta} \right) | \hat{\theta} = \tilde{\theta} \sim U[0, 1],$$

and  $Pr \left\{ \hat{\theta} = \tilde{\theta} \right\} = p^* > 0$  by Assumption 5, we thus have that

$$\begin{aligned} & Pr_{P_{n_s}} \left\{ F_{TN} \left( Y_{n_s} \left( \hat{\theta}_{n_s} \right); \mu_{Y, n_s} \left( \tilde{\theta}; P_{n_s} \right), \widehat{\Sigma}_{Y, n_s} \left( \hat{\theta}_{n_s} \right), \mathcal{Y}_{n_s} \right) \geq 1 - \alpha | \hat{\theta}_{n_s} = \tilde{\theta} \right\} \\ & \rightarrow Pr \left\{ F_{TN} \left( Y^* \left( \hat{\theta} \right); \mu_Y^* \left( \tilde{\theta} \right), \Sigma_Y^* \left( \hat{\theta} \right), \mathcal{Y}^* \right) \geq 1 - \alpha | \hat{\theta} = \tilde{\theta} \right\} = \alpha, \end{aligned}$$

which verifies (65).

Since this argument holds for all  $\tilde{\theta} \in \Theta$ , and Assumptions 3 and 4 imply that for all  $\theta, \tilde{\theta} \in \Theta$  with  $\theta \neq \tilde{\theta}$ ,

$$\limsup_{n \rightarrow \infty} Pr_P \left\{ \|X_n(\theta)\| = \|X_n(\tilde{\theta})\| \right\} = 0,$$

Lemma 6 implies (60).  $\square$

**Proof of Corollary 3** Follows from Proposition 14 by the same argument used to prove Corollary 1.  $\square$

**Proof of Proposition 15** Note that by the definition of  $CS_{U, n}$

$$\begin{aligned} & \mu_{Y, n} \left( \hat{\theta}_n; P \right) \in CS_{U, n} \\ \iff & Y_n \left( \hat{\theta}_n \right) \in \left[ c_l \left( \mu_{Y, n} \left( \hat{\theta}_n; P \right), \widehat{\Sigma}_{Y, n} \left( \hat{\theta}_n \right), \mathcal{Y}_n \right), c_u \left( \mu_{Y, n} \left( \hat{\theta}_n; P \right), \widehat{\Sigma}_{Y, n} \left( \hat{\theta}_n \right), \mathcal{Y}_n \right) \right] \end{aligned}$$

where  $\mathcal{Y}_n$  is as defined in (66) while  $(c_l(\mu, \Sigma_Y(\theta), \mathcal{Y}_n), c_u(\mu, \Sigma_Y(\theta), \mathcal{Y}_n))$  are as defined immediately before Lemma 14, after replacing  $\mathcal{Y}^K$  with  $\mathcal{Y}_n$ .

By Lemma 11, to prove that (61) holds it suffices to show that for all  $\{n_s\}$  and  $\{P_{n_s}\}$  satisfying conditions (1) and (2) of Lemma 11,

$$\lim_{s \rightarrow \infty} Pr_{P_{n_s}} \left\{ \mu_{Y, n_s} \left( \hat{\theta}_{n_s} \right) \in CS_{U, n_s} | \hat{\theta}_{n_s} = \tilde{\theta} \right\} = 1 - \alpha.$$

Thus, it suffices to show that

$$\lim_{s \rightarrow \infty} Pr_{P_{n_s}} \left\{ Y_{n_s}(\hat{\theta}_{n_s}) \in \left[ c_l \left( \mu_{Y, n_s}(\hat{\theta}, P_{n_s}), \widehat{\Sigma}_{Y, n_s}(\hat{\theta}_{n_s}), \mathcal{Y}_{n_s} \right), c_u \left( \mu_{Y, n_s}(\hat{\theta}, P_{n_s}), \widehat{\Sigma}_{Y, n_s}(\hat{\theta}_{n_s}), \mathcal{Y}_{n_s} \right) \right] \mid \hat{\theta}_{n_s} = \tilde{\theta} \right\} = 1 - \alpha.$$

To this end, note that by Lemma 12,

$$\left( Y_{n_s}, \mathcal{Y}_{n_s}, \widehat{\Sigma}_{n_s}, 1\{\hat{\theta}_{n_s} = \tilde{\theta}\} \right) \rightarrow_d \left( Y^*, \mathcal{Y}^*, \Sigma^*, 1\{\hat{\theta} = \tilde{\theta}\} \right),$$

and thus, by Lemma 14 and the continuous mapping theorem, that<sup>32</sup>

$$\begin{aligned} & \left( Y_{n_s}(\tilde{\theta}), c_l \left( \mu_{Y, n_s}(\tilde{\theta}, P_{n_s}), \widehat{\Sigma}_{Y, n_s}(\tilde{\theta}), \mathcal{Y}_{n_s} \right), c_u \left( \mu_{Y, n_s}(\tilde{\theta}, P_{n_s}), \widehat{\Sigma}_{Y, n_s}(\tilde{\theta}), \mathcal{Y}_{n_s} \right), 1\{\hat{\theta}_{n_s} = \tilde{\theta}\} \right) \\ & \rightarrow_d \left( Y^*(\tilde{\theta}), c_l \left( \mu_Y^*(\tilde{\theta}), \Sigma_Y^*(\tilde{\theta}), \mathcal{Y}^* \right), c_u \left( \mu_Y^*(\tilde{\theta}), \Sigma_Y^*(\tilde{\theta}), \mathcal{Y}^* \right), 1\{\hat{\theta} = \tilde{\theta}\} \right). \end{aligned}$$

By construction,

$$Pr \left\{ Y^*(\tilde{\theta}) \in \left[ c_l \left( \mu_Y^*(\tilde{\theta}), \Sigma_Y^*(\tilde{\theta}), \mathcal{Y}^* \right), c_u \left( \mu_Y^*(\tilde{\theta}), \Sigma_Y^*(\tilde{\theta}), \mathcal{Y}^* \right) \right] \mid \hat{\theta} = \tilde{\theta} \right\} = 1 - \alpha,$$

and  $Y^*(\tilde{\theta}) \mid \hat{\theta} = \tilde{\theta}, \mathcal{Y}^*$  follows a truncated normal distribution, so

$$Pr \left\{ Y^*(\tilde{\theta}) = c_l \left( \mu_Y^*(\tilde{\theta}), \Sigma_Y^*(\tilde{\theta}), \mathcal{Y}^* \right) \right\} = Pr \left\{ Y^*(\tilde{\theta}) = c_u \left( \mu_Y^*(\tilde{\theta}), \Sigma_Y^*(\tilde{\theta}), \mathcal{Y}^* \right) \right\} = 0.$$

Hence,

$$\begin{aligned} & Pr_{P_{n_s}} \left\{ Y_{n_s}(\hat{\theta}_{n_s}) \in \left[ c_l \left( \mu_{Y, n_s}(\tilde{\theta}, P_{n_s}), \widehat{\Sigma}_{Y, n_s}(\hat{\theta}_{n_s}), \mathcal{Y}_{n_s} \right), c_u \left( \mu_{Y, n_s}(\tilde{\theta}, P_{n_s}), \widehat{\Sigma}_{Y, n_s}(\hat{\theta}_{n_s}), \mathcal{Y}_{n_s} \right) \right] \mid \hat{\theta}_{n_s} = \tilde{\theta} \right\} \\ & = \frac{E_{P_{n_s}} [1\{Y_{n_s}(\hat{\theta}_{n_s}) \in [c_l(\mu_{Y, n_s}(\tilde{\theta}, P_{n_s}), \widehat{\Sigma}_{Y, n_s}(\hat{\theta}_{n_s}), \mathcal{Y}_{n_s}), c_u(\mu_{Y, n_s}(\tilde{\theta}, P_{n_s}), \widehat{\Sigma}_{Y, n_s}(\hat{\theta}_{n_s}), \mathcal{Y}_{n_s})]\} 1\{\hat{\theta}_{n_s} = \tilde{\theta}\}]}{E_{P_{n_s}} [1\{\hat{\theta}_{n_s} = \tilde{\theta}\}]} \\ & \rightarrow \frac{E[1\{Y^*(\tilde{\theta}) \in [c_l(\mu_Y^*(\tilde{\theta}), \Sigma_Y^*(\tilde{\theta}), \mathcal{Y}^*), c_u(\mu_Y^*(\tilde{\theta}), \Sigma_Y^*(\tilde{\theta}), \mathcal{Y}^*)]\} 1\{\hat{\theta} = \tilde{\theta}\}]}{E[1\{\hat{\theta} = \tilde{\theta}\}]} = 1 - \alpha, \end{aligned}$$

as we wanted to show, so (61) follows by Lemma 5.

Since this result again holds for all  $\tilde{\theta} \in \Theta$ , (62) follows immediately by the same argument as in the proof of Proposition 14.  $\square$

<sup>32</sup>Note that when  $\hat{\theta} = \tilde{\theta}$ ,  $\mathcal{Y}^*$  is either equal to the real line, or contains at least one interval with a continuously distributed endpoint. Hence, the almost-everywhere continuity established in Lemma 14 is sufficient for us to apply the continuous mapping theorem.

**Proof of Proposition 16** Follows by the same argument as in the proof of Proposition 11.  $\square$

**Proof of Proposition 17** Follows by an argument along the same lines as in the proof of Proposition 12, using Lemmas 11, 12, and 13 in place of 5, 8, and 9, and using the conditioning event  $\{Y_n(\hat{\theta}_n) \in \mathcal{Y}_n^H\} = \{Y_n(\hat{\theta}_n) \in \mathcal{Y}_n\} \cap \left\{ \mu_{Y,n}(\hat{\theta}_n, P_n) \in CS_{P,n}^\beta \right\}$ .  $\square$

**Proof of Corollary 4** Follows by the same argument as in the proof of Corollary 2.  $\square$

**Proof of Proposition 18** Follows by the same argument as the proof of Proposition 17, using Lemma 14 rather than Lemma 13.  $\square$

## E Additional Simulation Results for Stylized Example

In the stylized example discussed in Section 2 of the main text, we focus on the median length of confidence sets and the median absolute error of estimators. In this section, we report results for other quantiles, in particular that  $\tau$ -th quantiles for  $\tau \in \{0.05, 0.25, 0.5, 0.75, 0.95\}$ .

Figures 6 and 7 show the unconditional quantiles of the length of the 95% confidence sets  $CS_U$  and  $CS_{ET}$ , for cases with  $|\Theta|=2, 10, \text{ and } 50$  policies. In each case and for each  $\tau \in \{0.05, 0.25, 0.5, 0.75, 0.95\}$ , the  $\tau$ -th quantile is monotonically decreasing in  $\mu(\theta_1) - \mu(\theta_{-1})$ . Noting the different scales of the y-axes, we see that the upper quantiles grow as the number of policies increase, particularly for small  $\mu(\theta_1) - \mu(\theta_{-1})$ .

Figures 8 and 9 show the unconditional quantiles of the length of 95% hybrid confidence sets  $CS_U^H$  and  $CS_{ET}^H$  with  $\beta=0.005$ . Compared with Figures 6 and 7, the upper quantiles are much smaller, especially for small  $\mu(\theta_1) - \mu(\theta_{-1})$ . This substantial reduction in length directly comes from the construction of the hybrid confidence sets, which ensures that  $CS_U^H$  and  $CS_{ET}^H$  are contained in  $CS_P^\beta$ . For the case of  $|\Theta|=50$ , even the 95% quantiles of the length of  $CS_U^H$  and  $CS_{ET}^H$  are shorter than the length of  $CS_P$  uniformly over the range of  $\mu(\theta_1) - \mu(\theta_{-1})$  values we consider.

Figures 10, 11, and 12 examine the performance of point estimators for  $\mu(\hat{\theta})$ . They plot the unconditional quantiles of the absolute error of the conventional estimator, the median unbiased estimator, and the hybrid estimator, respectively. In spite of the severe median bias shown in Figure 1 in the main text, the distribution of the conventional estimator is relatively concentrated compared to that of the median unbiased estimator. In particular, the upper quantiles of the absolute errors of  $\hat{\mu}_{1/2}$  are very large for small  $\mu(\theta_1) - \mu(\theta_{-1})$  (similar to the quantile plots of the length of  $CS_U$  and  $CS_{ET}$  shown in Figures 6 and 7).

At the cost of a small median bias, the hybrid estimator substantially reduces the

absolute errors (Figure 12). The 95% quantile of the absolute errors of the hybrid estimator is overall similar to the 95% quantile of the absolute errors of the conventional estimator with a notable exception of the case of 2 policies. In contrast, for  $|\Theta| = 10$  and 50, and for quantiles other than 95%, the hybrid estimator outperforms the conventional estimator over a wide range of values for  $\mu(\theta_1) - \mu(\theta_{-1})$ . These numerical results show that the hybrid estimator successfully reduces bias without greatly inflating the variability of the estimator.

## F Additional Results for EWM Simulations

Tables 8 and 9 provide the ratios of the 5<sup>th</sup>, 25<sup>th</sup>, 50<sup>th</sup>, 75<sup>th</sup> and 95<sup>th</sup> quantiles of the lengths of  $CS_{ET}$ ,  $CS_U$ ,  $CS_{ET}^H$  and  $CS_U^H$  relative to the corresponding length quantiles of  $CS_P$  for the EWM data-calibrated designs described in Section 6 of the main text. Looking at the upper quantiles in Table 8, we can see that the conditional confidence sets  $CS_{ET}$  and  $CS_U$  can become very wide when the maximal element of  $\mu_X$  is not well-separated from the others. On the other hand, Table 9 shows that the hybrid approach is very successful at mitigating this problem. Indeed,  $CS_{ET}^H$  and  $CS_U^H$  dominate  $CS_P$  across nearly all quantiles and simulation designs considered. Table 10 reports the same quantiles of the studentized absolute errors of  $\hat{\mu}_{\frac{1}{2}}$ ,  $\hat{\mu}_{\frac{1}{2}}^H$  and  $Y(\hat{\theta})$ . Here we can see that, although the hybrid estimator  $\hat{\mu}_{\frac{1}{2}}^H$  does not dominate the conventional estimator  $Y(\hat{\theta})$  according to this performance measure, it does dominate  $\hat{\mu}_{\frac{1}{2}}$  across all quantiles and DGPs considered. This dominance is especially pronounced at higher quantiles. The underlying message here is a bit more nuanced than that which applies to the confidence sets: when minimal bias is desired,  $\hat{\mu}_{\frac{1}{2}}^H$  is the preferred estimator.

**Table 8:** Ratios of Length Quantiles Relative to  $CS_P$

DGP	$CS_{ET}$ Quantile					$CS_U$ Quantile

## G Additional Results for Tipping Point Simulations

Tables 11 and 12 provide the ratios of the 5<sup>th</sup>, 25<sup>th</sup>, 50<sup>th</sup>, 75<sup>th</sup> and 95<sup>th</sup> quantiles of the lengths of  $CS_{ET}$ ,  $CS_U$ ,  $CS_{ET}^H$  and  $CS_U^H$  relative to the corresponding length quantiles of  $CS_P$  for the tipping point data-calibrated designs described in Section 7 of the main text. The main takeaways from these tables are analogous to those that apply to tables 8 and 9 for the EWM data-calibrated designs. Table 13 reports the same quantiles of the studentized absolute errors of  $\hat{\mu}_{\frac{1}{2}}$ ,  $\hat{\mu}_{\frac{1}{2}}^H$  and  $Y(\hat{\theta})$ . Again, the main features of this table are similar to those of Table 10. However, note that in this application, the hybrid estimator  $\hat{\mu}_{\frac{1}{2}}^H$  not only exhibits minimal bias, in contrast to the standard estimator  $Y(\hat{\theta})$ , but also exhibits lower studentized absolute errors across most quantiles and designs considered.

## G.1 Additional Results for Split-Sample Approaches

Table 14 provides the ratios of the 5<sup>th</sup>, 25<sup>th</sup>, 50<sup>th</sup>, 75<sup>th</sup> and 95<sup>th</sup> quantiles of the length of our newly proposed equal-tailed split-sample confidence set  $CS_{SS}^A$  relative to the corresponding length quantiles of the conventional split-sample confidence set  $CS_{SS}$  for each of the tipping point data-calibrated designs described in Section 7 of the main text. Since every entry in this table is less than one, we can see that the dominance result illustrated in Table 7 of the main text is further reinforced: the length quantiles of  $CS_{SS}^A$  are shorter than those of  $CS_{SS}$  across all quantiles and simulation designs considered. Table 15 reports the same quantiles of the studentized absolute errors of our newly proposed split-sample estimator  $\hat{\mu}_{SS, \frac{1}{2}}^A$  and those of the conventional split-sample estimator  $Y^2(\hat{\theta}^1)$ . Though both of these estimators are median unbiased for  $\mu_Y(\hat{\theta}^1)$ ,  $\hat{\mu}_{SS, \frac{1}{2}}^A$  dominates  $Y^2(\hat{\theta}^1)$  in terms of studentized absolute errors across all quantiles and simulation designs considered.
